All being thus prepared for a successful aggression upon the law of patronage, the subject was again introduced at the Assembly of 1834. The public interest upon the question had been excited in no ordinary degree: it was the reform bill of the Scottish church; and upon its passing, not only the tranquillity of the nation, but the permanence of its ecclesiastical establishment depended. The 350 members of which this great representative meeting of the national church consisted, had its usual proportion of the lay element in its ruling elders, who were in number to the clerical as four to five; and as the Moderate and Evangelical parties were now nearly, if not altogether balanced, while every single vote was of importance, each member was at his post, and the Tron Church, Edinburgh, in which the meeting assembled, was thronged with anxious spectators. The motion, which was made by Lord Moncrieff, son of the Rev. Sir Henry Moncrieff, the late leader of the Evangelical party in the church, was substantially the same as that of Dr. Chalmers in the preceding year, and was to the following effect.—"That the General Assembly having maturely considered the overtures, do declare that it is a fundamental law of the church, that no pastor shall be intruded on any congregation contrary to the will of the people; and that in order to carry this principle into full effect, the presbyteries of the church shall be instructed that if, at the moderating in of a call to a vacant pastoral charge, the major part of the male heads of families, members of the vacant congregation and in full communion with the church, shall disapprove of the person in whose favour the call is proposed to be moderated in, such disapproval shall be deemed sufficient ground for the presbytery rejecting such person, and that he shall be rejected accordingly, and due notice thereof forthwith given to all concerned: but that if the major part of the said heads of families shall not disapprove of such person to be their pastor, the presbytery shall proceed with the settlement, according to the rules of the church: and further declare, that no person shall be held to be entitled to disapprove, as aforesaid, who

shall refuse, if required, solemnly to declare in presence of the presbytery, that he is actuated by no factious or malicious motive, but solely by a conscientious regard to the spiritual interests of himself or the congregation: and resolve that a committee be appointed to report to an interim diet of the Assembly, in what manner, and by what particular measures, this declaration and instruction may be best carried into full operation." Such was the amount of modification that was sought in the law of patronage. It was merely a vindication of the old law established in the standards, and illustrated in the history of the Church of Scotland, that "no pastor shall be intruded on any congregation contrary to the will of the people." But was the church competent in itself to enact a law by which patronage was made to depend upon the will of the people, and its presentations to be only available when confirmed by the popular acceptance? This was admitted even by the Moderates themselves, and the right was clearly explained by Lord Moncrieff in the speech with which he prefaced his motion:—"I want no more," said this accomplished master in civil and ecclesiastical Scottish law—

"I want no more than what is contained in the act of 1690, qualified as it is by the act of Queen Anne, and the laws of the church by which that act is ordered to be carried into effect. The act of 1690 gave the election to the elders and heritors being Protestants. But did it rest there? No. It goes on to assert the powers of the church in a material point, ordaining that the heritors and elders are to propose the person to the congregation, and if they disapprove of him, the reasons are to be given in to the presbytery, by whose determination the collation of the minister is to be completed. The act of Queen Anne in 1712 repeals this act only so far as relates to the presentation of the minister by the elders and heritors; it alters nothing as to the manner in which the individual is to be presented to the congregation, and it is still in force on this point. Was it not recognized by the act of Assembly in 1736 and 1782? and is it not recognized in the con-

stant practice of our presbyteries sending the individual to the congregation to preach before them?" The debate preceding the settlement of this important question lasted from eleven o'clock in the forenoon till eleven at night, and it ended in the success of Lord Moncrieff's motion by a majority of 184 to 138. Thus was the veto established as the law of the Church of Scotland.

This recognition of a great popular right, which had been so long and so vainly demanded, was not the only triumph obtained by the Evangelical party. In the preceding year the Moderates themselves had recognized the churches erected and partly endowed by parliament as parochial charges, by investing their ministers with parochial authority, and the right to a seat in church courts. These privileges, which were granted to the churches lately established in the more destitute districts, and especially in the Highlands, had at the same time been sought for the chapels of ease, but this demand the Moderates rejected. These chapels had been erected by the congregations themselves, who also possessed the right of electing their own pastors; and it was thought that their admission into church courts would strengthen the popular

REV. DR. CHALMERS
From a portrait by John Faed, R. S. A.

party, more especially as a great increase of such chapels was confidently anticipated. The demand was renewed at the Assembly of 1834, and with greater effect. It was evident indeed that the new plan of church extension, at the head of which was Dr. Chalmers, needed such encouragement and support: for while six hundred dissenting chapels had been erected in Scotland during the course of a century, only sixty-three chapels of ease in connection with the Establishment had been erected, whose congregations had no sessional courts or share in the government of the church. The anomalous position of such ministers in a church of Presbyterian parity, and of congregations thus excluded from the common rights of a worshipping people, together with the urgent need of more churches, were so strongly enforced, that the admission of chapels of ease to the status of parish churches was decreed by a large majority of 152 to 103. The beneficial effects of this

measure were quickly manifested by the result. In one year alone, after the passing of the act of Assembly, sixty-four new churches were built or in the course of erection, being one more than the number that had been raised during the whole of the previous century.

The veto act was now established; but would its merely negative character be sufficient to neutralize a positive evil? And when it came into exercise, would the patrons themselves be ready to submit to the authority by which it had been passed? These inevitable questions were soon to be answered in a very unwelcome fashion. In 1834, the minister of Auchterarder, a parish in the south of Perthshire, died, and Mr. Robert Young, a licentiate of the church, was presented to the living by the Earl of Kinnoull, its patron. But where was the parochial call, the most essential passport of a presentee? It was forthcoming indeed, but signed by no more persons than the earl's factor and two individuals, who had appended their names to the document commencing with, "We, the heritors, elders, heads of families, of the parish of Auchterarder"—which contained a population of three thousand souls! This would have been sufficient in the preceding century, especially if backed by a troop of dragoons; but these times had passed away, and this mere verbalism of a call was opposed by 287 out of 330 church members, who subscribed their dissent to Mr. Young's admission as their pastor. Thus, by the new law he was decisively vetoed, and the presbytery, as in duty bound, rejected the presentation. But Mr. Young appealed to the synod; and on this higher court confirming the sentence of the presbytery, he appealed to the last and highest of all, the General Assembly. Here also the rejection, after being carefully considered, was confirmed by a large majority, and the presbytery of Auchterarder, thus justified, refused to induct the presentee. This ought to have been conclusive, more especially as by the veto-law, and during the whole course of these church-court trials, the civil rights of the rejected preacher to the manse, glebe, and stipend were recognized, independently of his discharge of the functions of a minister, so that he could claim them let whosoever might be elected as the pastor of Auchterarder. But this was an alternative the shame of which was too much for patronage to endure—and herein was felt the first great difficulty of the veto-law: like other half measures, it only complicated the evils which it had been designed to remove. The earl and his protégé removed their case to the Court of Session, thus acknowledging the right of a merely civil tribunal to enforce a preacher's admission into the ministerial office. Upon this monstrous footing indeed the decision of the court was not

placed, although it virtually came to that conclusion; for it decreed that the presbytery of Auchterarder, by refusing to induct Mr. Young, had acted to the harm of the pursuers, and contrary to their duty and to certain statutes, and especially to the act of Queen Anne confirming the rights of patronage. They were not to be forced to invest him with the ministerial office, but only punished for refusing to do so. This decision was given in March, 1838, on the strength of which Mr. Young's law agent demanded that his client should be taken on trials for his induction; and on the refusal of the presbytery of Auchterarder to comply, he threatened its members with a prosecution for pecuniary damages. As civil pains and penalties thus impended over the presbytery, it was commissioned by the General Assembly to appeal to the House of Lords; but there, after a long discussion, the sentence of the Court of Session was confirmed. On receiving this decision, the General Assembly in 1839 decreed, by a majority of 204 to 155, that no further opposition should be given by the Auchterarder presbytery to the claims of Mr. Young to the emoluments of the benefice, but also, that the principle of non-intrusion as a fundamental principle of the Church of Scotland should not be abandoned or compromised. It was likewise resolved that, as by carrying this principle into effect it now appeared that the legal sustentation of the ministry may be suspended, and as they were desirous of avoiding any collision between the civil and ecclesiastical authorities, a committee should be appointed, for the purpose of considering in what way the privileges of the national Establishment and the harmony between church and state may remain unimpaired; with instructions to confer with the government of the country if they shall see cause.

This case of Auchterarder was only the commencement of the warfare, and a new and still more severe trial of the veto-law was to succeed at Lethendy. The minister of this parish being old, infirm, and unfit for duty, Mr. Clark was appointed by the crown his assistant and successor: but when he was about to be ordained, a majority of the male heads of the congregation protested against his appointment, in consequence of which it was set aside in terms of the veto act. The old minister died, and the crown issued a new presentation in favour of Mr. Kessen, who was acceptable to the people. Encouraged however by the decision of the Auchterarder case, Mr. Clark obtained from the Court of Session an interdict against the appointment of Mr. Kessen; but this the presbytery rejected as illegal, and fortified by the authority of the General Assembly, they ordained Mr. Kessen on the 13th

of September, 1838. In consequence of this, Mr. Clark again appealed to the Court of Session, who pronounced the presbytery guilty of breaking the interdict, and summoned its members to their bar. They went accordingly, and were there punished with a severe rebuke, and warned that their next offence of the same kind would be visited with a still heavier penalty.

The next trial which the veto had to encounter was that of Marnoch. This parish having become vacant in 1837, Mr. Edwards, who had been the minister's assistant for three years, received a presentation from the patron; but he had been so unacceptable to the parish, that when his call was presented, it was signed by only one parishioner who was entitled to vote, and the names of three heritors who signed by proxy; while against his admission was a protest subscribed by 261 heads of families, out of a roll of 300 communicants. In spite of this rejection, Mr. Edwards insisted upon his claim, and in this case he had the presbytery of Strathbogie to second him, who brought a charge of intriguing and caballing on the part of the parishioners of Marnoch before the synod of Moray; but the synod condemned the conduct of the presbytery as illegal, and ordered them to find the presentee disqualified by the rejection of the people for being minister of Marnoch. The presbytery then appealed to the General Assembly in 1838, on the plea that they only wished to interpose the highest authority of the church to justify their rejection of the presentee; upon which the assembly reviewed their previous proceedings, and authorized them to reject Mr. Edwards. He was set aside accordingly, and a new presentation was given by the patrons in favour of Mr. David Henry. But with the whole church thus against him, Mr. Edwards would not yet yield: he appealed to the Court of Session, and obtained from it a decision interdicting Mr. Henry from presenting himself to the presbytery for ordination, and the presbytery from proceeding to his induction. Encouraged by this powerful aid, the presbytery of Strathbogie resumed its opposition, by a vote for delaying proceedings until the question should be legally decided; against which decision an Evangelical minority protested, and appealed to the synod, by whom the case was referred to the final decision of the next General Assembly. But confident in the protection of the civil power the presbytery would not await the decision of the highest church court, and for their contumacy, the recusant ministers, seven in number, were suspended from their clerical office by an authoritative sentence of the Assembly's commission. Against this sentence the ministers appealed to the Court of Session, requesting them

to remove it, and prevent the verdict from being published in their parishes, or the ministers of the Assembly from preaching in their churches, churchyards, or school-houses; but although much of this was beyond the power of a civil court, it did what it could to the utmost—it barred the churches, churchyards, and school-houses against the entrance of the ministers commissioned by the Assembly, so that they were obliged to announce its sentence of suspension, and preach to the people in the open air. But the seven still continued in the discharge of their clerical offices; and not content with this defiance of the church in its collective capacity, they proceeded to crown their rebellion by admitting the rejected presentee to the ministerial charge of Marnoch. They accordingly took Mr. Edwards on trials, found him duly qualified, and on the 21st of January, 1841, proceeded to his induction. The whole nation was astounded at their hardihood, and none more than the parishioners of Marnoch, who could scarcely believe the testimony of their senses when they saw the presbytery assembled in the church for ordination, notwithstanding their protest, and the high authority with which it was corroborated. Having seen that this was a reality, they arose and departed, leaving the strangers who had come from a distance as the only witnesses of those solemn services by which their souls were consigned to the care of a stranger whom they had so expressly rejected, and whose voice they would not hear.

The church had now arrived at a crisis where to pause or recede was equally impossible; and, had it been united, its advance would have been irresistible. But it was still a divided body, and the party so long in the ascendancy and so lately held in check, were beginning to take courage in the prospect of state support, and prepare for a fresh encounter, with the civil power for their ally. When the Assembly's commission in March, therefore, passed a vote of sympathy with the parishioners of Marnoch, and when the Assembly itself in May, 1841, decreed a sentence of deposition upon the seven Strathbogie ministers, rescinded the settlement of Mr. Edwards, and ordered the presbytery to proceed with the induction of Mr. Henry, the Moderate party rallied for fresh opposition. Invoking the state to aid and support them, and representing the opposite party as rebels, they identified themselves with the deposed martyrs of Strathbogie, whom they still recognized as ministers, and encouraged to hold out by preaching in their pulpits and assisting them in their clerical public duties. And by which of these parties was the Church of Scotland represented? Statesmen in London were at a loss to decide, and even their Scottish

advisers were in many instances bewildered. To enlighten them on this question a public manifestation was necessary; and accordingly an extraordinary meeting was held in the West Kirk of Edinburgh on the 25th of August, which was attended by 1200 ministers and elders, who unanimously passed a series of resolutions asserting the freedom of the church from secular control, and maintaining the principle of non-intrusion. This, it might be thought, was evidence enough of the prevailing spirit of the church, but unfortunately it failed to convince; and when a second appeal was made to the House of Lords upon the case of Auchterarder, in consequence of the Court of Session having decreed an action against the presbytery for refusing to ordain Mr. Young, the sentence was confirmed by the lords. This final decision was conclusive in every such case where nothing opposed the imposition of a minister upon a parish except his rejection by the people. It was also decided by the House of Peers as an incontrovertible principle, that all church courts, even in their spiritual functions, were subject to the coercion of the civil magistrate.

By this summary process the great controversy of the Scottish church for nearly three centuries was settled at once, and by a downright blow. But would the blow be submissively received? Would no reaction follow? The history of Scotland scarcely warranted such an illogical conclusion. Even at the best such a secession must ensue as would rend the church in twain, and make it a matter of indifference to which portion of the fragments the title of an Establishment should be awarded. Something, however, it was still necessary to do in order to avert such a national calamity; and accordingly a circular was issued by thirty-two of the oldest and most respected ministers of the church, inviting their brethren from every part of Scotland to a conference which was to be held upon the subject at Edinburgh. In reference to the late decision of the lords, the invitation stated: "Without entering into the legal merits or demerits of the judgment, its undoubted effect is to place us in a position where we may represent, with all deference to the legislature, that the specific statute rested on by the civil court has now for the first time, and in opposition to all former opinions, been so construed as to place it in direct conflict with the constitution unalterably secured to the national church of this country. We can, therefore, present this alternative to the legislature, and crave their own decision upon it—Whether they will destroy the constitution of the church or remodel this particular statute: and, so long as we have the faith of treaties and of coronation oaths for our securities, we may hope that the legislature will yet

respect the privileges assigned sacredly and inviolably to our church, and which, both at the Revolution and at the union of the kingdoms, were declared to belong to her without any alteration for ever." This meeting, known as the Convocation, was held in Edinburgh on the 17th of November, 1842, and was attended by 465 ministers. The sittings were continued for a week, and the discussions were accompanied with careful deliberation and with devotional services. It was felt that the decisions of the civil courts were subversive of the constitution of the church, and, unless a remedy was devised, must end in its destruction. But what, in such a case, would be the most efficient remedy? and what would be their duty if no such remedy was granted? A fresh "non-intrusion" measure was suggested, but speedily negatived as hopeless, while a holding-on to the Establishment under such repeated injuries would only provoke fresh aggressions that might end in a popular revolution. The gentler as well as safer course was to retire from an Establishment in which they could no longer remain with the approval of their own consciences and in consistency with their past professions. This conclusion was intimated in two series of resolutions. By the first it was declared that the second judgment given by the lords in the Auchterarder case was subversive of all spiritual jurisdiction and fatal to the very existence of church government. By the second series it was declared to be the duty of the church to terminate its connection with the state should no redress be granted. Having thus decisively committed themselves upon the issue, the ministers retired to their homes and prepared themselves for the worst.

It was no wonder if these decisions were sufficiently perplexing to our statesmen, presenting as they did an alternative which statesmen have seldom to encounter. It was something new for them to be told that so large a body of churchmen, after so long a period of deliberation, had consented to renounce all the proverbial comforts of their position rather than recede from their principles; and they thought that when it reached the abandonment of manse, glebe, and stipend, the *argumentum ad crumenam* would prevail. In this belief they were fortified by representations from Edinburgh, which assured them that not forty, perhaps not even twenty of these clergymen would retire, when the crisis actually arrived. No hope of redress was therefore held out; and the day for the meeting of the General Assembly arrived, on which the protesters must redeem their pledges. It was the 18th of May, 1843—a day memorable in modern Scottish history; and St. Andrew's Church, Edinburgh, in which the Assembly was held, was filled with a crowd of anxious spectators. After

the usual preliminaries were finished, and when the business of the house should have commenced, the Rev. Dr. Welsh, the moderator of the Assembly, stood up to address the lord-commissioner. But it was only to announce the final resolution of himself and his brethren, and to bid the Assembly a last farewell. "According to the usual form of procedure," he said, "this is the time for making up the roll; but in consequence of certain proceedings affecting our rights and privileges—proceedings which have been sanctioned by her majesty's government, and by the legislature of the country; and more especially in respect that there has been an infringement on the liberties of our constitution, so that we could not now constitute this court without a violation of the terms of the union between church and state in this land, as now authoritatively declared, I must protest against our proceeding further. The reasons which have led me to this conclusion are fully set forth in the document which I hold in my hand, and which, with permission of the house, I shall now proceed to read." He then read the protest which had been prepared and sanctioned three days previously at a meeting of the brethren, and at the close, he laid it upon the table before the clerk of the Assembly, bowed to the lord-commissioner, and retired. This final movement was the signal of departure, and a long train followed composed of city and country ministers, men of the highest distinction for worth and talent, and holding some of the best livings of the church and the universities; and of those ruling elders, the lay element of the Scottish ecclesiastical government, who had resisted every aggression of the state upon the rights of the church until resistance was unavailing. The promise was fulfilled; the dreaded event had taken place; and those who remained in the half-emptied building gazed at the dissolving view as if yet only half assured of its reality. Nor was the popular feeling out of doors less lively, as soon as the long train appeared, and marched silently and slowly downward to the distant hall which had been hastily prepared to receive them in the anticipation of such a departure. From the crowded street, from the crowded windows and housetops, a thunder-peal of approbation welcomed them, while many strong men sobbed, or turned aside under feelings too big for utterance. The ministers who had thus left their all behind them were the chosen and cherished of the people; they had vindicated their high characters by the voluntary endurance of a penalty tantamount in modern ecclesiastical reckoning to that of martyrdom itself; and now, as homeless and bereaved men, they were going forth to the wide world ignorant as yet of what might await them. This, then, was in very deed

the Disruption!—a great ecclesiastical revolution which a grievance of two centuries had produced at last. And yet, unlike other great national changes, in which the popular feeling is wound up to the uttermost, it was a revolution at the climax of which not a blow was struck, not a threat uttered. But not the less was it pregnant with most momentous consequences, both to the present age and to generations yet unborn. It was a great silent movement, such as religious principle alone could have produced, and such a country as Scotland have exhibited.

As a new General Assembly was to be held, and a new church constituted by those who had forsaken the old, the departing members repaired to the appointed place at the Canonmills, a suburb lying at the foot of the hill at the northern extremity of Edinburgh. The building which received them was a disused gas-work that had been erected upon the model of a Moorish palace or *hambra*, and in its chief hall 3000 expecting spectators were already assembled to welcome them. A new moderator of the Assembly was to be elected, and Dr. Chalmers, the father of the movement, was appropriately called to the chair; new church office-bearers were to be appointed, which was done with equal unanimity; and the usual religious solemnities were observed, and the business of the Assembly commenced, as if each member had already found his place after nothing more than a momentary interruption. At the opening speech of the venerable moderator, after a short history of the claims of the church and their rejection by the legislature, Dr. Chalmers thus continued:—"We now make a higher appeal from our constitution, which has been disregarded, to our conscience, which tells us that the ecclesiastical ought not to be subjected to the civil power in things spiritual. We are therefore compelled, though with great reluctance and deep sorrow of heart, to quit the advantages of the British establishment, because she has fallen from her original principles, in the hope that we shall be suffered to prosecute our labours in peace on the ground of British toleration. These are the principles that have occasioned the movements of this day, and brought us together on the present occasion. And now, reverend fathers and brethren, it is well that you should have been strengthened by your Master in heaven to make the surrender you have done of everything that is dear to nature, casting aside all your earthly dependence rather than offend conscience, incur the guilt of sinful compliance by thwarting your own sense of duty, and run counter to the Bible, our great church directory and statute-book. It is well that you have made for the present a clear escape from this condemnation, and that in the issue of the contest between a

sacrifice of principle and a sacrifice of your worldly possessions you have resolved upon the latter; and while, to the eye of some, you are without a provision and a home, embarked on a wide sea of uncertainty, save that great and generous certainty which is apprehended by the eye of faith, that God reigneth, and that he will not forsake the families of the faithful. We read in the Scriptures, and I believe it will be found true in the history and experience of God's people, that there is a certain light, and joyfulness, and elevation of spirit consequent upon a moral achievement such as this. There is a certain felt triumph, like that of victory after conflict, attending upon a practical vindication which conscience has made of her own supremacy when she has been plied by many and strong temptations to degrade or to dethrone her. Apart from Christianity altogether, there has been realized a joyfulness of heart, a proud swelling of conscious integrity, when a conquest has been effected by the higher over the inferior powers of our nature; and so among Christians too, there is a legitimate glorying, as when the disciples of old gloried in the midst of their tribulations, when the Spirit of glory and of God rested on them, when they were made partakers of the divine nature and escaped the corruption that is in the world, or as when the apostle Paul rejoiced in the testimony of his conscience." The venerable and eloquent speaker did not forget that this was also an opportunity for warning, and therefore he solemnly added—"But let us not forget in the midst of this rejoicing the deep humility that pervades their songs of exultation—the trembling which these holy men mixed with their mirth—trembling arising from a sense of their own weakness: and then courage, inspired by the thought of that aid and strength which were to be obtained out of His fulness who formed all their boasting and all their defence. Never in the history of our church were such feelings and such acknowledgments more called for than now; and, in the transition we are making, it becomes us to reflect on such sentiments as these:—'Not me, but the grace of God in me,' and 'Let him that thinketh he standeth take heed lest he fall.'"

Thus was the Free Church of Scotland constituted, and its first General Assembly held. The sittings continued from the 18th to the 30th of May, and during this period a great variety and amount of business was transacted. And foremost of these was the deed of demission, by which the retiring clergymen announced their abandonment of the Established church and the

livings they held in it, which was subscribed by 474 ministers. A new machinery was needed for instant action, involving the erection of churches and schools, the sustentation of ministers and teachers, the support of missions at home and abroad—for all those schemes of evangelization, instruction, and active benevolence of which the ministers of the Free church, while in connection with the Establishment, had been the principal founders and supporters. But never had Scottish ardour been so tempered with calculation and prudence as upon the present trying occasion. Instead of waiting and hoping to the last, and thus incurring the risk of being taken at unawares, the rejection of their demands by the state and the necessity of a separation had already been anticipated, and every preparation made for such an event, so that when it arrived, it by no means came upon them unprovided. Even before its arrival, 687 associations had been formed throughout the country, and by their exertions in raising funds, should a disruption be found necessary, £232,347 had been raised within two months, which, by the contributions that afterwards arrived from London, Ireland, and America, was raised to £366,719. There was thus a fund awaiting it, both for present emergencies and future action, of which the Free church could avail itself at the outset.

In these associations and these contributions, the unmistakable sympathies of the people had been announced, and the course they were likely to pursue, by which the ecclesiastical disruption should become a great national movement. In almost every case, the bulk of the congregation followed the retiring minister; the Established churches over the land were suddenly half-empty; and in some of the more remote counties, such as Ross and Sutherland, the exodus was so complete, that little more was left of the old order of things than the ministers themselves, with their door keepers and church-officers and a few conservative heritors. But even more remarkable than the disruption among the clerical order at home, were the effects of it among the Scottish missionaries abroad—men whose spheres of action had been assigned, and means of labour furnished by that revived evangelical spirit of which this great movement was the result. However remote from the seat of action, they had watched every proceeding with the most intense sympathy; and as soon as tidings of the crisis reached them, they formally abandoned their connection with the Establishment, and joined the Free Church of Scotland. This, too, was done so promptly, so spontaneously, and universally, notwithstanding their separation from each other, and lack of the means of mutual concert, as showed their convictions upon

¹ Buchanan's *History of the Ten Years' Conflict*, vol. ii. chap. xiv. xv.; Hetherington's *History of the Church of Scotland: Annual Register*, 1843; Martineau's *History of the Last Thirty Years: Disruption Memorials*, &c.

which side the right lay, and how well prepared they were to follow it.

So signal a commencement took the whole British public by surprise. But it was not to them alone that the sensation was confined. Into every country where the report went forth, there was a feeling of astonishment not unmingled with sympathy and respect. They had read of the sacrifices and struggles at the Reformation, when princes abandoned their thrones, and communities perilled their national liberties, rather than abandon the cause of religion, and do violence to their consciences. But so long a reign of political utilitarianism had succeeded, that these sacrifices had been deemed the characteristics of an age that had for ever passed away—exploits that exclusively belonged to a romantic period of the world's history, and which men might read of, but could never hope to see again. But, lo! that season had returned; even the nineteenth century could furnish an army of martyrs and confessors; and thoughtful inquiring men, whom the tidings had roused in different continental countries, repaired to Scotland that they might witness the phenomenon with their own bodily eyes, and record it in their books. But all this only made the enemies of the Disruption more indignant, and they declared that it was nothing more than a spasmodic throes that would speedily be followed by utter prostration. In spite, however, of their angry predictions, the first effort was but the commencement of a permanent habit, and the Free church still exists as a solid reality. An idea also of its steady increase may be formed from the fact, that it now possesses in Scotland 875 places of worship and numbers 846 ordained ministers, independently of those congregations which it has in England and Ireland, on the Continent and in the colonies. It has two colleges, one at Edinburgh and another at Glasgow, besides a theological hall in Aberdeen, at which 194 students are educated for the ministry. It has also a home mission, with an annual revenue now nearly amounting to £10,000, by which the most benighted of our districts are pervaded with religious instruction, and in the working of which the missionary students are trained for the practical duties of the ministry. And even reduced to the secular but convincing criterion of pounds, shillings, and pence, the present condition of the Free church not only indicates the zeal and liberality of the people, but the stability of the cause. The following general abstract, showing the sums raised for the various objects of the Free Church of Scotland for the year from 31st March, 1858, to 31st March, 1859, is more illustrative of the subject than any amount of disquisition:—

Sustentation Fund, ...	£110,485	7	6
Building Fund, ...	41,179	2	0½
Congregational Fund, ...	94,481	19	6
Missions and Education, ...	55,896	11	0
Miscellaneous, ...	41,384	12	10
Total, ...	£343,377	12	10½

From the foregoing sketch of the history of religion in Britain during these thirty years, it will be distinctly seen that the age of apathy and indifference had expired; that the struggle of a new and better life had commenced; and that these convulsive efforts, painful though they might be, were proofs of vitality, and promises of a happy result. The cold dull repose of the valley of death had ended, and the moving of the dry bones was the needful prelude to the rising up of a living multitude. But while this stir was necessarily accompanied with much contradiction and contention, there was one great and holy object in which all sects harmonized, and upon the work of which they all heartily co-operated. It was that of missionary enterprise, which, having commenced with the present century, had been going on since the close of the preceding period with fresh impulses and a wider application. But the time has not yet arrived for writing the history of these missions, and we can only afford for them a passing notice. In England the following were the principal missionary institutions that arose during the present period, with the year of their establishment, and their field of operation:—

- 1840. Welsh Foreign Missionary Society—India.
- 1844. The (Free) Presbyterian Church in England—China.
- 1844. The Patagonian Missionary Society—Patagonia and South America.
- 1845. The Naval Missionary Society for the Loo Choo Islands.
- 1850. The Chinese Evangelization Society.

In Scotland, the following missionary societies were originated, viz.:—

- 1835. The United Presbyterian Synod Missionary Society—West Indies, West Africa, and Caffraria.
- 1842. The Reformed Presbyterian Synod—New Hebrides
- 1843. The General Assembly of the Free Church of Scotland—India, Caffraria.
- 1848. Home Mission of the Free Church.

In Ireland—

- 1840. The General Assembly of the Presbyterian Church in Ireland—India.¹

The united expenditure of the British missionary societies averages nearly or about £600,000 per annum, an amount which is freely and cheerfully paid through the annual public appeal to British benevolence. This cordial response on the part of the Christian public is the more to be admired, when we take into account the difficulties and discouragements with which missionary enterprise has hitherto been attended, and

¹ Dr. Brown's *History of Missions*; Annual Missionary Reports.

the results as yet apparently so inadequate to such a numerous agency and liberal expenditure. But it is a trial of Christian faith; and it is patiently endured, in the full belief that the regeneration of the world is certain, however long delayed or obstinately resisted. Years of waiting and watching are not thought too much to be bestowed in fertilizing the desert, and rearing anew the cedars of Lebanon. We doubt not that the twentieth century will initiate a glorious missionary history to which the nineteenth was only a preparative.

While the missionary cause has been thus so active, its great instrument of action—the Bible—has accompanied all its movements, so that while no country has been too barbarous or remote for a Christian mission, no language has been deemed too rude or barren as a vehicle for Christian instruction. There is scarcely, therefore, a language or a dialect into which the Scripture has not been translated, or region into which it has not been introduced. In this good work the British and Foreign Bible Society has attained a pre-eminence worthy of the public confidence it has secured, and the vast machinery it has been able to put in motion; and to give an idea of the latter, it is enough to state that, while it has been the parent of many others, there are between 8000 and 9000 auxiliary societies belonging to it, which are extended like a net-work over Great Britain and Ireland, among our colonies, and in foreign countries.

While the wants of the heathen have thus been so amply cared for, by making a copy of the Bible accessible, and its language intelligible to all, the same solicitude has been manifested for the ignorant of our own country. It was soon felt that for every cottage to have a Bible, and every cot-

tager to be able to read it, was a hopeless wish, so long as the book itself was made so costly that the poor would not purchase it, or at least could not, without a heavy sacrifice. An agitation for cheap Bibles was the consequence, and it commenced in Scotland in 1839, when the profitable monopoly of the queen's printers to print the Bible had expired. The renewal of their patent was successfully resisted, chiefly through the exertions of the Rev. Dr. Adam Thomson of Coldstream, and by a decree of parliament a board was established in Scotland for granting licenses to print the authorized versions of the Scriptures. The effect of this has been, that the Bible, formerly one of the dearest, is now one of the cheapest books in circulation. In England, indeed, the monopoly of printing the Bible still belongs to the universities of Oxford and Cambridge, and to her majesty's printer for England; but in consequence of a controversy on the subject in 1840, the prices of Bibles and Testaments have been so greatly reduced as to place them within the reach of the poorest of the English community.

In this brief sketch of the history of religion from A.D. 1830 to the present day, we have only adverted to some of the leading points, and that, too, in a very scanty and cautious manner. But for this reluctance we are certain that the reflective reader will forgive us. Reminiscence and suggestion are what he chiefly demands when the subject has become so personal to himself; and to this modest limit we have endeavoured to confine our view, more especially as it is the history of action still going onward, and the result of which is still unknown. To our successors we bequeath the duty of recording its development.

CHAPTER XXIV.—HISTORY OF SOCIETY.

FROM THE ACCESSION OF WILLIAM IV. (A.D. 1830), TO THE PRESENT TIME (1860).

Difficulties in the detail of Progress during the present period—Commercial position of Britain at the commencement of this period—Causes of her commercial pre-eminence—The cotton trade—Improvement in its manufactures—Extent of the cotton trade—Its effect in the increase of our manufacturing towns—Attempts to benefit our other manufactures at the expense of that of cotton—State of our linen and woollen manufactures—Our iron manufactures—Coal used instead of wood in the smelting of iron—Invention of the hot-blast—The coal trade of Britain—Relative money value of our exports and imports—Shipping and men employed in them—The Great Industrial Exhibition of 1851—Preliminary minor exhibitions—Universality of the invitation to the Industrial Exhibition of 1851—Erection of the Crystal Palace in Hyde Park—Its opening on the 1st of May—Desire to perpetuate the plan of the Exhibition—Erection of the new Crystal Palace at Sydenham—Its various collections—Its elevating, intellectual, and industrial tendencies—Improvement in the application of steam power—Desire to extend locomotion by steam to land as well as sea conveyance—The first experiments in land travelling by steam—The Stephensons—The Liverpool and Manchester railway—The first locomotive employed on it—Rapid multiplication of railways—The railway mania—Its effects—Railway travelling and its profits—Its dangers shown at its commencement—Parliamentary enactments for the safety of railway travelling—Highways and canals partially superseded by the railway—Increase of the means of comfortable living effected by industrial improvements—Statistics of this increase as compared with former periods—The grain and cattle markets of Britain and their supplies—Necessary inequality in the distribution of this abundance—Continued increase in the numbers and destitution of the poor—Facilities of Britain in furnishing means for the unemployed—Our colonies, and their adaptation to every class—Increase of emigration to the colonies—Our Australian colonies—The gold discovery—Its attractions to emigration—Immense returns from the Australian gold fields—Their effects in the rapid growth of these colonies—Persons fitted to succeed as emigrants—Wonderful effects of emigration upon the Irish—Immense remittances made by them to their friends in Ireland—Condition of the lower classes in Britain during the present period—Their increasing numbers and deterioration—Causes of this increase—Defective education for the lower classes—Restrictions on the transfer and sale of land by the strictness of the law of entail—Consequent decrease of our independent yeomanry—Decrease of our small farmers—Disappearance of our open air field-sports and pastimes—Multiplication of rural ale-houses and civic haunts of dissipation—Statistical amount of pauperism during the present period—Gross immorality in its mode of life—Prevalence of infanticide—Criminal convictions—Comparative criminal statistics of 1817 and 1857—Interposition of government to the growth of crime—Remedies of social science applied to the lowest orders—The national vice of drunkenness—Its hold upon the lowest orders—Institution of temperance societies—Their beneficial effects—Remedies for the classes immediately above the lowest—Cheap publications—Their origin, character, and purpose—Their good effects on the working and middle classes—Improvement of public education—Normal schools—Associations for public improvement—Progress of science—Electricity—Invention of the electric telegraph—Extent of its operations—Its modes of communication—Electricity applied to the service of the fine arts—Invention of the art of electrotypes—Photography—Its origin—Invention of the daguerreotype and calotype processes—Their improvements, application, and uses—Chemistry—Its extensive application—Its important uses in agriculture—Astronomy—Recent extension of astronomical discovery—Its discoveries applied to the improvement of navigation—Astronomical societies and observatories in Britain—Zeal of private students in the science—Lord Rosse's telescope—Star-clouds—Their perplexing character—Geology—Recently reduced to a science—Antagonistic theories of the earth by Hutton and Werner—Their followers, the Vulcanists and Neptunists—Smith's discoveries in the secondary rocks of England—Rapid improvement and extension in geological research—Practical application of the science—Geography—Revival of the attempt to find a north-west passage to India—Expeditions to the polar regions—Their discoveries and failures—Hopelessness of the attempt to discover the north-west passage—Explorations in Africa—The travellers Denham, Clapperton, Lander, &c.—Expedition to Negroland by Richardson, Overweg, and Barth—Communications between the Cape of Good Hope and the interior of Africa—Discoveries of Dr. Livingston—Expedition of Burton and Speke to the lake Tanganyika—Geographical discoveries of travellers in the interior of Australia—Discoveries in North America—Trigonometrical survey of the British Islands and India—Improvements in hydrography—Application of the improvements of science to the art of war—Its greater destructiveness—Probable results of the change—Exclusive cultivation of science during the last thirty years—Its effect upon literature—Present state of literature in Britain—Eminent writers of the last period who have been continued to the present—Authors in literature exclusively of the present period—Increase of female authorship—Predominance of novel-writing in the present day—Causes of this predominance—General character of our present novel-writing—Principal authors in this department—Female novelists—Periodical literature, magazines, and reviews—The newspaper—Influence of newspapers in the government of every country—Special adaptation of the newspaper for Britain—Universal demand for it—Origin and history of newspaper writing in Britain—Restrictions imposed on newspapers by a government tax—Effects of these restrictions—Their removal—

Consequent multiplication of newspapers—Poetry—Its present scantiness among us contrasted with the previous abundance—Causes of this dearth—Our living poets—Predominance of the poetry of action over that of words—Tennyson—His principal poems—His successful attempt to revive the ancient romance in poetry—Resources afforded to modern literature by our public libraries—Libraries of the universities—Library of the British Museum—Its origin, growth, and contents—Its accommodations for general study—Public libraries of Scotland—Progress of the fine arts—Painting—Discouragements of historical painting in Britain—Promise given of its revival in the decoration of the new Houses of Parliament—Unsatisfactory result—Prevalence of *genre* painting in the British school of art—The pre-Raphaelite school of painting—Its effects in producing greater correctness—Present state of our national school of painting—Influence of photography on art—Means used for the improvement of the public taste—Picture collections thrown open to the public—The National Gallery—Sources of its accumulation—The Turner, Vernon, and Sheepshanks collections—The National Portrait Gallery—Its regulations and tendencies—The Hampton Court collection and Greenwich Naval Gallery—The Scottish National Gallery—Art-Unions—Their effect in cultivating a general taste for art—Establishment of schools of design—Necessity for their establishment—Their beneficial effect upon our manufactures—Progress of sculpture—Our public monuments—Progress of architecture—Imitative tendency of our architects—Progress of music—Attempts to popularize it—The Volunteer movement—Reviews in London and Edinburgh—Effects of the movement—Conclusion.

WE now approach the last portion of our task—the history of the progress of the living generation—with misgiving of heart and a reluctant step. For let the character and spirit of the record be what it may, a history of the present period cannot fail to disappoint and to offend. Every man has viewed the period for himself, and in relation to his own principles, interests, or prejudices; and amidst such a contrariety, each reader will find that something has been omitted, something exaggerated, something misrepresented. It was not thus when we dealt with past events and with the dead, or described a state of society in every way inferior to the condition of the present day. The sympathy that could be excited for departed worth, and the self-complacency that could be flattered by the superiority of the living over the dead, are, in this case, exchanged for the feelings of a present struggle, of which every one has a personal share and his peculiar point of observation. In such a difficulty, the utmost we can attempt is lightly to touch the more important points of the subject—to be suggestive rather than communicative—and content ourselves with pointing out the path to be trod, rather than attempt to lead the way, and be the *cicerone* of every stage of the journey. To this limited duty we are also necessarily confined by the magnitude and complexity of the subject, for which whole volumes, instead of a single chapter, are usually found insufficient.

When the present period in the history of national progress had arrived, Britain had fully realized the important character for which she was destined: by her commerce and manufactures she had become the metropolis of the world. To this high position her whole career for years and for ages had been pointing. Her insular situation, which gave her the command of the whole ocean for her highway; her fertile

soil, which served as a capital with which she could advance her mercantile successes or encounter their reverses; the national character of her people, in which the interfusion of several races was combined with a harmonious blending of their activity, industry, perseverance, and inventiveness—all these had been the natural preparations for a destiny of which Tyre, Carthage, Palmyra, Holland were but imperfect types. And all these advantages, so greatly surpassing whatever had been possessed by former commercial states, were crowned by the nature of her laws and the character of her government. The imposts of feudalism, the restrictions of monopolies, the various taxes which an earlier age had imposed upon industrial activity and enterprise, had one by one been removed, and at no time more than during the earlier part of the present period. But more than all these combined, was the inviolability of property, and the liberty of the subject, which formed the great characteristics of the British constitution. Men might traffic where they listed, and afterwards enjoy the fruits of their industry without check or interference. Mercantile communities might construct works and invest sums to any amount, of which the distant returns could only be realized by their heirs, without the dread that all might be swept away, by either those anarchical or despotic revolutions to which other governments were liable. The vine and fig-tree under which our commercial wealth so confidently reposed were not the growth of a night; and though the passing winds might shake their branches, they could not loosen their roots. Such was the commercial conviction of our country amidst those national changes upon the Continent, by which governments had been subverted and dynasties overturned; and in this confidence, an extent of traffic had been undertaken, and an amount of capital sunk, that will form a rich inheritance for future generations.

The chief article of all this manufacturing

industry, and commercial enterprise and wealth, is cotton, which being sent to this country in its original state, is fabricated into every kind of clothing which luxury or comfort can demand, and sent out to every part of the earth. An inquiry therefore into this great staple of our trade demands our first consideration.

At the commencement of the nineteenth century, the boundless wealth contained in this branch of traffic began to be surmised, and the national ingenuity, aided by the resources of science, was on the stretch to devise expedients by which the tedious processes of preparing cotton manufactures might be simplified and improved. The methods invented for converting the raw material into yarn, and weaving the yarn into webs of every colour, texture, and variety, are among the noblest specimens of human ingenuity; and their reward is exhibited in the statistics of our cotton trade, as compared with its nature and results in former periods. This change has especially been perceptible since the year 1814. It was then that the remarkable fall commenced which has taken place in the price of cotton goods in general. Of this change it is enough to state, that, whereas in 1814, 100 yards of calico would cost 16s. 6d., 650 yards can now be had for 20s. 6d. The cause of this change has been partly owing to the great fall in the price of the material, but the main cause is to be found in the immense multiplication and improvement of our machinery. The same cause, instead of diminishing, has only proportionably increased the value of this department of our commerce, by extending the use of our cotton fabrics not only among the women of Britain, but over the whole world. This advantage, also, we are still enabled to retain, notwithstanding the rivalry of other nations, through our abundant resources of iron and coal for the application of steam, and the superiority of our power-looms and other cotton-working machinery.

Of the progress of our cotton trade an estimate may be formed, by the quantity of raw material imported into Britain during fourteen years of the present period. In 1840 it amounted to 592,488,010 lbs., in 1845 to 721,979,953, in 1854 to 887,335,904, and in 1858 to 1,034,342,176. To turn this raw material to account, our cotton manufactures alone are calculated to employ 542,000 weavers, spinners, bleachers, &c., and 80,000 engineers, machine-makers, smiths, masons, joiners, &c. The value of the products of this cotton manufacture is estimated at about £52,000,000 per annum, of which £17,000,000 are expended in wages to the several above-mentioned craftsmen, leaving a satisfactory profit to their employers.

The power of the cotton trade has been mani-

festated in the increase of our principal cities during the present period, as well as the general wealth it has created. Thus, Liverpool, which in 1831 had a population of 165,175 inhabitants, had increased in 1851 to 375,955. Glasgow, which in 1831 had 202,426 inhabitants, and in 1841 274,533, had increased in 1851 to 347,001 inhabitants. Manchester and Salford, which in 1831 had a population of 227,808, had in 1851, 367,232 inhabitants. But even the smaller cotton manufacturing towns of England have increased with equal rapidity. Thus the population of —

	Inhabitants.		Inhabitants.
Preston was, in 1780,	6,000	...	In 1851, 69,542
Blackburn	1801, 11,980	...	„ 1851, 46,536
Bolton	1801, 17,416	...	„ 1851, 61,171
Wigan	1801, 10,989	...	„ 1851, 81,941

Of the larger towns in the above enumeration, few have profited by the cotton trade so greatly as Glasgow, which was one of the first to avail herself of this source of commercial prosperity. It has been mainly through its prolific agency at the outset, and the great development of her iron and coal trade which followed, that her population, which at the commencement of this century was about 75,000, now falls little short of half a million, while in wealth as well as population, she is now virtually the capital of Scotland. The manufacture of muslins, which commenced in Scotland in 1825, has been since that period carried on almost entirely by Glasgow houses, one of which alone in 1857, when this department of industrial enterprise had reached its height, employed 500 men and 1500 women in the city, and from 20,000 to 30,000 females, partly in Ayrshire and other districts of Scotland, but mostly in Ireland.

The rapid predominance in the manufacture of cotton above every other commodity, created alarm in the minds of over-prudent statesmen, who foresaw, in this use of a foreign product, the depreciation of our own home-produced material, upon which the industry of our country had so long been exercised, and its commercial character mainly founded. What was to become of our linen and woollen manufactures, if the demand for their cloths was to be superseded by the other cheaper produce? The short-sighted expedient was adopted of laying a tax upon calico-printing, in order to bring up its price to that of linen and woollen stuffs. Accordingly, so early as 1774, a duty was imposed upon it of 3d. per yard, which in 1806 was raised to 3½d. But a more intelligent and liberal spirit had commenced with the present period, under which any kind of restriction upon any branch of manufacture and commerce was to find little favour; and on the entrance of Mr. Paulett Thompson into office, as vice-president of the board of

trade, in 1830, this tax upon calicoes was repealed. The effect of this wholesome measure was speedily apparent. In 1829 only 89,862,433 yards of all descriptions of printed goods were exported; but in 1841 the exportation of printed cottons alone amounted to 329,240,892 yards, of the declared value of £7,772,735. But bounties upon the articles of commerce were now as ungracious as restrictions, and therefore, during the same year in which this calico-tax was taken off, the bounty on the exportation of linen as well as of several other articles was withdrawn.

Of our linen manufactures a brief notice will now suffice. It was natural that they should yield to the predominance of cotton, more especially after the state patronage was withdrawn from them; and accordingly, the trade in linen, although still important, is not so great as in former periods. Throughout the United Kingdom the linen manufacture employs 133,000 hands, while its annual value is estimated at £10,000,000.

In our former notices of the mercantile progress of the country, the importance of its woollen manufactures was distinctly stated: these indeed constituted the chief source of its wealth, and as such were still worthy of cultivation: they also continued to be indispensable, as their products will be needed, let whatever other articles be used along with them, in furniture and clothing. It was fortunate also that the resources of improved skill and new materials were at hand for cheapening the price and thereby extending the use of woollen fabrics. The first step in this direction was made about the year 1834, when goods which had been manufactured from wool alone began to be made of worsted weft and cotton warp, by which the trade was greatly increased. Another improvement that followed in 1836 was the introduction of the wool of the alpaca or Peruvian llama, and subsequently the introduction of mohair, or goat's wool of Asia Minor. The final step was to combine silk itself with this mixture of common wool, alpaca, and mohair; and this, with the application of improved machinery, has so benefited our woollen manufactures, as to insure for them a ready market in every part of the world. The continued importance of this department of manufacture is attested by the fact, that there are 1282 woollen factories in England and Wales, of which 807 belong to Yorkshire alone. Of this county, the great woollen mart of the kingdom, the town of Bradford may be considered the centre and capital, where the worsted manufactures are most abundant, and have been best cultivated and improved. The fruits of this industry have been shown in the statistics of the town. In 1801 Bradford contained

only 13,264 inhabitants, but in 1851 they had increased to 103,782. In the first of these years it possessed no more than three mills, but in the last it had upwards of 160 in active operation.

Scarcely inferior in national importance are our iron manufactures, in the working of which Britain was inferior to other countries until nearly the middle of the last century, on account of timber only being used in the process of smelting, and the consequent failure which took place in this kind of fuel, so that more than two-thirds of the iron used in our island had to be imported from abroad. And yet, even so early as 1619, Edward Lord Dudley had invented a process for smelting iron with pit coal instead of timber; and in that year he took out a patent for the purpose, but the works erected by his lordship were destroyed by the ignorant rabble, and himself almost ruined by the loss. Thus affairs continued until the great scarcity of wood revived the memory of Lord Dudley's attempt; and about the year 1740 pit-coal was once more used in the making of iron at Colebrookdale, and two or three other places. And even then, thirty more years had to elapse before coal instead of timber came into general use. The progress of this change may be estimated from the following brief statement. In 1740 the quantity of pig-iron made in England and Wales amounted to about 22,000 tons; in 1788 it had risen to 68,000, in 1796 to 125,000, in 1806 to 250,000, and in 1820 to 400,000 tons. From the growing use of iron for many purposes not originally contemplated, and especially from the multiplication of steam-engines, and the construction of railroads, the produce of iron throughout England, Scotland, and Wales, which in 1825 amounted to 615,236 tons, had risen in 1848 to 2,008,200 tons. In 1857 the continuing rise had brought up the amount to 3,659,447 tons. The greatest improvement of our own day in the smelting of iron has been the invention of Mr. J. B. Neilson of Glasgow. Formerly, the air of the blast furnaces was uniformly at the temperature of the atmosphere from which it was taken; and the effect was, not only to produce a lower degree of heat, but to supply a quantity of moisture which is prejudicial to the process of smelting. This moisture, which is always more or less in the atmosphere, is most prevalent during the summer; and from this cause, the furnace could not work so well in that season as in winter. But by Mr. Neilson's invention of the hot-blast, the air is previously dried and heated to a high temperature; the consumption of fuel is lessened to a tenth of what was formerly used in heating the furnace; while the absence of moisture has a beneficial effect on the quality of the iron. This discovery, first used in Lanarkshire, and the rich

strata of ironstone and coal with which that county abounds, have proved a mine of wealth to the district, and a source of prosperity to Glasgow, by which that city has now become the second in the empire. The money value of our pig-iron, which in the present year is more than 3,500,000 tons, has been estimated in round numbers as worth £14,000,000, but the bar-iron that may be formed from it will amount to £19,000,000. Nearly a third of our iron is principally used in Great Britain and Ireland, in consequence chiefly of the great demand in railways, the building of iron ships, and the forging of iron cables; but our exports of all kinds of iron in 1857 amounted to 1,539,386 tons, worth in declared value £13,603,337.

This immense iron manufacture could not have been carried on without that almost exhaustless supply of coal that lies side by side with those metallic strata which are dependent upon its igneous powers. The use of British coal has therefore been in correspondent demand with the requirements for steam travel both by sea and land; and this increase of the coal trade is still rapidly going onward in consequence of the general adoption of steam agency in every European country, and the removal of the duties on its exportation. This consumption of coal in iron manufactures alone will be understood by the fact, that three tons of coal are required for the production of every ton of wrought iron. The total of coal exported from the United Kingdom in 1857 amounted to 6,483,416 tons, valued at £3,019,228. The coal shipped coastwise in the United Kingdom during the same year was from 9,000,000 to 10,000,000 tons. The coal imported into London alone in 1858, by common roads, railways, and canals, was 1,213,464 tons, and by sea 3,266,446 tons. And when will this richest, most useful, and most necessary of mines be exhausted? It is an important national question, which was answered by Dr. Buckland in the House of Commons in 1829, when he confirmed the statement that the coalbeds of South Wales alone contained fuel enough to supply England for 2000 years. And yet, if even all the coal of our island should last for only half that period, Britain will have attained, as a nation, a longevity of which no other country can boast. But upon such a distant futurity what heart, however patriotic, would dare to calculate?

Having thus given in detail our principal manufactures, which constitute the staple of our national stability and strength, we conclude by presenting a summary of them in the aggregate, by which their amount and importance will be more clearly recognized. In 1854 the total declared value of the exported produce and

manufacture of the United Kingdom amounted to £97,298,909. Of this the value of £64,400,587 was sent to foreign countries, and £33,698,313 to India and our colonies. In 1855, the value of the manufactures exported was £95,346,429; in 1856, £115,544,154; and in 1857, £121,769,396.

Other articles, not the produce or manufacture of Great Britain and Ireland, constitute a portion of our national commerce, and must be taken into account. Including these in the table of exports and imports, the progress of our commercial industry and wealth during the present period may be estimated from the three following years:—

	Exports.				Imports.			
There were in 1831,.....	£69,691,302	11	7	...	£46,245,241	6	6	
„ „ 1840,.....	110,198,716	0	0	...	62,004,000	0	0	
„ „ 1850,.....	190,101,394	0	0	...	106,101,607	0	0	
„ „ 1857,.....	285,863,927	0	0	...	136,215,849	0	0	

Turning from the mere money value of these articles, to the occupation they gave to men and shipping, the accounts of the same years are thus summed up:—

	Vessels.	Tons	Men.
1831. British and Irish,.....	12,248	2,006,397	119,143
Foreign,.....	5,158	758,368	39,769
1840. British and Irish,.....	17,635	3,101,650	170,339
Foreign,.....	10,326	1,831,366	79,550
1850. British and Irish,.....	30,576	6,044,662	317,810
Foreign,.....	14,259	2,238,860	115,395
1857. British and Irish,.....	37,014	5,510,154	284,135
Foreign,.....	23,460	4,863,191	...

In these brief statements, the adventurous enterprise, the wealth, the stability of the nation can be best recognized: they are the official returns of those silent campaigns and bloodless achievements upon which the power of Britain is founded, and by which her fame will be best perpetuated to the admiration and wonder of every future age. And now, then, for the grand review, in which the victorious armies of commerce should be mustered for public parade, its banners displayed, its trophies inaugurated! Such a parade, after careful preparation and upon an adequate scale of grandeur, was to be given in the Great Exhibition in Hyde Park, in the memorable year 1851.

It is interesting to notice the first steps of a design so magnificent in its conception and so important in its consequences. They date no earlier than 1756—about the same time that the Royal Academy opened its public exhibitions in painting, engraving, and sculpture. It was then that the productions of art and skill were collected and displayed in London, for the purpose of stimulating public industry and inventiveness; and although these exhibitions were on a limited scale, they were found so useful, that the plan was adopted in France, and there continued with the happiest effect, even when it had long been abandoned in England. In the former

country, the exhibition was so excellent in 1844, and the benefits of the previous displays so apparent, that the English roused themselves from their remissness, and during the years 1847 and 1848 they re-opened their exhibitions, chiefly at the instigation, and by the aid of the Society of Arts, by whom the plan had been revived. So great was now the recognized importance of these industrial displays, that they became a subject of national consideration; and it was felt that something more was necessary than France or England had as yet attempted, to give them their proper development and effect. At this point, a happy idea occurred to his royal highness Prince Albert, the consort of our beloved sovereign: it was to gather together into one place the best specimens of contemporary art and skill, and the natural productions of every soil and climate, instead of the mere local or national productions of France and England. It was to be a whole world of nature and art collected at the call of the queen of cities—a competition in which every country might have a place, and every variety of intellect its claim and chance of distinction. Nothing great, or beautiful, or useful, be its native home where it might—not a discovery or invention however humble or obscure—not a candidate however lowly his rank—but would obtain admission and be estimated to the full amount of genuine worth. It was to be to the nineteenth what the tournament had been to the fourteenth and fifteenth centuries—a challenge at once and welcome to all comers, and to which every land could send, not its brightest dame and bravest lance as of yore, but its best produce and happiest device for the promotion of universal happiness and brotherhood. It was further adapted to the free, generous, enlightened spirit of the nineteenth century, that it was to belong exclusively to the people themselves of every nation, instead of being supported and controlled by their respective governments. And that nothing might be wanting to its character as a great competitive trial, the sum of £20,000 was set apart for the expense of prizes which were to be awarded to the successful competitors.

This world-wide proclamation went forth into every country, and was met with universal welcome: it was a challenge such as men had never heard, to an emprise in which every nation might hope to be the victor. There was accordingly a stir and a preparation which in its nature formed a new era in the history of national contests. Little time was to intervene, for the great competition was to be opened in London on the 1st of May, 1851. But the place for the specimens and the spectators!—what single tent could lodge the army of Xerxes and all its equipments? This question occurred some-

what of the latest, and the directors of the Exhibition were non-plussed: they found on calculation that no building on earth would suffice to contain a tithe of it. After many expedients had been proposed and rejected, Mr. Paxton came forward with his simple plan, which effectually solved every difficulty. It was, to erect a huge building in the style of a garden conservatory, in which iron and glass should be almost the sole materials, wood being introduced only in the fittings. This method, so new, and so startling for its simplicity, was at once adopted, and the result was a building in Hyde Park nearly twice the breadth, and fully four times the length of St. Paul's. Never before had architecture combined such vastness of extent and adaptation to a specific purpose with such simple means; and when the building was finished in the short space of five months, the world was astonished to see the place where but yesterday, as it were, there had been nothing but trim walks and green sward. It seemed to realize the magnificent conception of the greatest of our poets—

“Anon, out of the earth a fabric huge
Rose like an exhalation.”

With its iron framework that rose towards the sky in dark slender lines, and its walls of glittering crystal that seemed to float in mid-air like a vapour, it appeared indeed an exhalation which a breath of wind might disperse—a *fata morgana* that would disappear with a sudden shift of sunshine. But on looking more nearly, it was seen to be a solid edifice, the iron pillars of which were rooted deep in the earth; while within, the combination of light and lofty arches, with ribs forming a graceful metallic net-work, gave strength and security to the edifice.

The “Crystal Palace,” as it was appropriately called, occupied twenty-one acres of ground, and contained eight miles of tables. Of this ample space a geographical division was made for the accommodation of the specimens from different countries—the whole of the building west of the great transept being assigned to Britain and her colonies, while all the space to the eastward of the transept was allotted to foreign countries and their colonies. Of the profusion of specimens, natural and artificial, which were collected within such a space, we can only state in general terms that they were comprised under four great classes or divisions:—1. Raw materials; 2. Machinery; 3. Manufactures; 4. Fine Arts. Of the numerous subdivisions of these we have not space even for the names, comprising as they did a voluminous encyclopedia of the world of nature and art. The inauguration of the Crystal Palace, this eighth wonder of the world, as it may be justly called, was in a style of magnificence and

imposing ceremonial worthy of the occasion. Notwithstanding the shortness of the time, all was completed for the promised day and hour; on the 1st of May, 1851, at twelve o'clock, the gates were opened, and her majesty Queen Victoria, accompanied by her royal consort, Albert Prince of Wales, the ministers and officers of state, the princes, ambassadors, and commissioners of all nations in official, military, or court attire, entered in full procession, — and

amidst such a noble retinue many an eye was turned upon the spare form of the venerable Duke of Wellington, while many a heart regarded this scene of promised peace and prosperity as the last and best trophy of his many victories. A splendid throne had been erected upon a large platform, overshadowed by a silken canopy; and besides this royal seat which had been prepared for her majesty, her coming was accompanied with that auspicious attendant of her

many progresses, a brilliant sunshine, that lighted up the halls, their treasures, and the crowds arrayed in their choicest attire, who were assembled in myriads within the building. Never indeed had a sovereign stood amidst such a magnificent display, or one so completely indicative of national happiness and prosperity. When the queen ascended the throne the national anthem was sung by a chorus of 800 performers, accompanied with the magnificent notes of an immense organ, and the voices of the spectators; after which the royal commissioners, with

the prince consort at their head, read to her majesty the report of the proceedings of the commission. The pile and its purposes were then inaugurated by a prayer from the Archbishop of Canterbury, invoking a blessing upon the undertaking, and the Exhibition was opened amidst the congratulations of the queen, and the responsive gladness of her subjects, who felt in this event the triumph of arts over arms, and the best promise of their country's safety and prosperity.

The Crystal Palace had only been erected for

a temporary purpose, and that purpose was at length accomplished. The nations of the earth had met under its roof, and each had been benefited by the competition. Each had seen wherein its defects lay, and had learned how they might be remedied; while all had recognized the superiority of Britain in whatever best conduces to the substantial welfare of society. Nor had our own country been neglectful of the opportunity; and this began to be manifested in more enlarged and refined perceptions of the beautiful in every department of art, and every produce of industry. But must this palace be plucked up, as well as its treasures dispersed? Must such realities pass away like the fictions of an eastern romance, and their very lessons fade through time into an indistinct remembrance? The wish to preserve the building as a permanent repository for the works of industry and art, and the productions of nature, was both intense and general, and applications were made in the first instance to government upon the subject in the earlier part of 1852; but as the original destination of the Crystal Palace had been already fulfilled, government did not feel itself warranted to purchase the building. There was little fear, however, that its materials would be dispersed as useless; for independently of the public benefits of the institution, the structure itself might be turned into a profitable mercantile speculation. Mr. Leech, a private gentleman, undertook the adventure of purchasing the palace, and removing it to a more eligible site. Others were ready to join him; a company was formed, and shares issued in the usual plan of a great mercantile joint-stock enterprise; and half a million of money was quickly raised to begin the undertaking. To make the new palace a place of universal resort, by being of easy access, as well to secure the means of conveyance for the materials of the building, a place on a metropolitan line of railway, and near London, was necessary; and accordingly 300 acres of ground were purchased for the purpose at Sydenham in Kent. Thither the palace was transferred piecemeal from Hyde Park with a facility that in earlier times would have seemed the work of enchantment. But something upon a grander scale was to be produced by the new building than the old. Its strength and its dimensions, the treasures it should contain, and the rich scenery with which it should be surrounded, were to transcend anything that Hyde Park had exhibited; and accordingly all the science, talent, and activity in the empire were employed to construct the new edifice, and collect or create the rich stores it was to contain. Accordingly, while the edifice was rising, and the grounds laying out upon a scale which surpassed the ancient glories of Babylon

or Hecatompylos, its artists and agents were sent into every country to procure casts and models of their choicest specimens of architecture, statuary, and sculpture; and arrangements were made to bring together every produce comprised in the wide world of nature and art into this great museum of Sydenham. Not only, indeed, do these specimens extend to the earliest products of human industry, but to those of nature herself before man existed; and thus, no division has been left in the whole range of science without its worthiest representatives and illustrations. On these accounts, a thoughtful walk through the Crystal Palace is a pilgrimage through all time, and into every country. The observer wanders through the Assyrian, Egyptian, Greek, Roman, and Alhambra courts; and in their specimens he sees the life and the history of man from the days of Nebuchadnezzar to those of the Abencerrages. From the verge of that dim and far-distant estuary in which the river of time is linked with the boundless sea of eternity, he passes upward through the classical, until he comes to the medieval ages, whose courts of illustration introduce him to the earlier part of the world that now is, and the dawns of that new civilization with which he is personally identified. And then follows the stir of the living age, in the courts of the various arts, sciences, and manufactures that lie before him—the picture gallery, the naval museum, the engineering models, the Indian court, the industrial museum and technological collection, the industrial exhibition, the agricultural machinery, and the machinery in motion—whose names alone are suggestive of their contents. The whole range of universal history, the whole progress of human improvement from the earliest ages to the present day, thus passes before his eyes like the movement of a peristrepheic panorama, and forty centuries glide on successively in the course of a few hours. The philosopher, the historian, the man of science, the lover of art or admirer of nature, the utilitarian and the philanthropist, the delicate fastidious man of taste and sentiment and the hard-handed, hard-working artisan have only to select, each for himself, his own favourite range in this vast museum of earth and time; and collected, as if for his own especial behoof, he will find an abundance that will leave him no room for ignorance, and a beauty that will satisfy his aspirations to the full. It is no wonder therefore if the exhibition of Sydenham has become what it was intended to be—a place of universal resort for the purposes of universal instruction and recreation. Honoured to future times be the names of those who devised such a palace as the dwelling of wisdom—who so combined all that is most alluring with whatever best tends to enlighten

and elevate—and who planted it so nigh to our great metropolis that its benefits can be circulated from the heart to the extremities of our empire! It may, indeed, pass away like an airy vapour, leaving no permanent ruins like those of the Coliseum; but its spectacles were far otherwise than those of gladiatorial shows, and its benefits will continue to be perpetuated when Roman triumphs are forgot!

While the industrial activity of Britain had been kindling at each step of advance until its enterprise had warmed into full glow, a still greater abbreviation of time and space as well as of labour was demanded, and mercantile impatience could no longer submit to the slow inter-communication of the mail or the post office

Deep-sea navigation by steam had not only been originated but perfected during the present period, so that no part of the ocean, however remote or stormy, was inaccessible to its visits; and giant ships, increasing yearly in magnitude, speed, and power, had begun a competition in naval architecture which has now swelled into that vessel of hitherto unmatched dimensions—the *Great Eastern*. It was now no longer a metaphor, but an every-day fact, that “time is money;” and the restless trafficker, who could waft his goods across the sea by steam navigation with a rapidity, punctuality, and safety, which to our fathers would have seemed fabulous, was irritated by the delay he encountered in passing from one town of the island to an-

GARDEN FRONT OF THE CRYSTAL PALACE, SYDENHAM.—From a drawing by J. L. Williams

other. Could he not contrive to travel as rapidly by land as by sea? And might not the power of steam, which had accomplished the former, be equally available for the latter achievement? The possibility indeed had been surmised so early, that it seemed a matter of chance whether the steam-boat or the steam-carriage should have had the priority in point of existence. In 1759, Watt, at that time a young man in his twenty-third year, and resident in Glasgow, had the idea imparted to him by Dr. Robison, then a student in the university, “of applying the power of the steam-engine to the moving of wheel-carriages and other purposes.” But the destiny of James Watt, which was sufficient for any individual man, was to develop that power in a different

VOL. IV.

direction; and thus, as far as he was personally concerned, the thought of steam travel by land was nothing more than a passing idea. But it was taken up by others, so that various attempts continued to be made for the application of steam to land conveyance; and although these were experimental trials, and were one and all unsuccessful, they were steps in advance to the mark. These preludings continued until George and Robert Stephenson (father and son) entered the field, to become the honoured founders of railway travelling. It had as yet been found hopeless to make the attempt on common highways, and against the obstacles of hill and valley; but the existence of tramroads in various parts of England, which at first were of wood, but afterwards were

seded in 1820 by iron rails, suggested the kind of pathway along which steam carriages could move. This plan was adopted in laying down the first

R STEPHENSON'S LOCOMOTIVE — THE "ROCKET," 1825

of the railways, called the Liverpool and Manchester railway in 1825, which served as the model of those that were afterwards constructed throughout the kingdom. Of these, the gauges are two: the broad, which is 7 feet between the rails; the narrow, which is 4 feet 8½ inches. The latter is adopted as the gauge for Great Britain. But besides constructing the path of travel, so that hill and dale should be reduced to nearly an even plane, and avoiding throughout its length every flaw from which danger might arise, the nature of the locomotive for this new and strange mode of journeying had to be studied as well as its highway; and it was quickly found, that this terrible iron behemoth upon which so much depended must carry its own fuel and water, and combine in perfection the qualities of compactness, lightness, and power. These requisites, as far as could be done at so early a stage of the trial, were secured by the locomotive made by the Stephenson, called the *Rocket*, which gained the prize in the competition, and was the first that was set a running upon the new railway. It was considered perfect in lightness, power, and speed, as it weighed only 4 tons, 5 cwt., drew after it 12 tons, 15 cwt., and moved at the rate of fourteen miles an hour, while its greatest speed was twenty-nine miles an hour.

The opening of the Liverpool and Manchester railway was the commencement of a new era in human history. It was the first link of the chain by which *terra firma* was to be united from sea to sea. Railway travel was now to accomplish for cities and for kingdoms what steam naviga-

tion was effecting for distant islands and continents; so that while the circumference of the world might be navigated in a few months, a country might be traversed in as many days or even hours. A restless activity was awakened which time can never abate, and a sweep of action and change afforded to the short threescore and ten years of human existence, for which the lives of the antediluvians would have been too brief. It was not strange that this triumph of British intellect should be regarded with national complacency, and that the success of the first great experiment should throw British capital and industry into a new path. Railways accordingly were commenced and opened throughout the principal lines of traffic; and when these were exhausted, others were devised in localities where new trades and populations were to be introduced by the change. No district was too remote, no ground too rugged to escape that exploratory spirit which went everywhere in search of a fresh opening, so that in 1845 and 1846 the disposition had grown into an absolute frenzy, and is now remembered as the railway mania. Of the height to which it had grown, a judgment may be formed from the fact, that during these two years alone, applications to parliament obtained assent for the construction of 7238 miles of railway. Amidst such speculation, it was natural that families should be ruined by the thousand, and whole fortunes dissipated as by a whiff of steam. It was well however for the community at large that these railroads were more substantial things than promissory notes and mercantile bubbles. By 1850 the frenzy was exhausted, or sobered down to the construction of 356 miles per annum, and by 1858 to 340. From the official report of 1857 it appeared that, by the end of that year, 9116 miles of railway, including seventy miles of railway tunneling and fifty miles of viaducts, had been constructed and were in use, employing 109,660 persons, from managers, secretaries, and clerks, down to porters, labourers, &c. Of these railway miles, 6777 belonged to England, 1269 to Scotland, and 1070 to Ireland. During the whole of this period of railway construction, the capital that had been raised for the purpose amounted to £314,989,626. Such an outlay is sufficient to explain the numerous wrecks of fortunes it occasioned, as well as to attest the energy it called forth, and the confidence that had been given to its promises. That the return though slow was both certain and profitable, was now however vouched by the railway report of 1857. During that year, upwards of 139,000,000 passengers had been conveyed, giving a return of ten and a half millions sterling. To this sum, we must add the conveyance of light and heavy goods, and live stock

during the year, averaging thirteen and a half millions sterling. Thus, the railway returns for this single year amounted in all to £24,174,609. Onward to the present day the impetus of railway travelling has increased, so that almost every journey of more than a mile is performed by steam. In 1859 about thirty millions of people passed in and out of London alone by its various railway termini.

But loss of fortune was not the only evil entailed by the railway; there was also the danger of loss of life; and this was gloomily announced at the very commencement, when Mr. Huskisson was killed at the opening of the Liverpool and Manchester Railway. It was to be no longer the deliberate downfall of a coach, in which the passengers, while emptied into a dry ditch, know whither they are going and what may be expected: it was rather a sudden crash or explosion, in which all were equally helpless, and where wounds and death in their most appalling forms might be multiplied an hundredfold. Nothing had ever been more completely devised to humble the pride of man than his helplessness in a railway-carriage, the masterpiece of his inventiveness and power: it is as if his spell had evoked a demon to do his bidding, but which at any moment may rend him in pieces or fling him to the winds. In a speed of motion, which upon the principal railways is often forty-five miles an hour, but which is sometimes raised to sixty miles, it was impossible but that terrible accidents should occur, and that they should at length demand the interference of the legislature. The matter was thoroughly investigated by a select committee of the House of Commons in 1858, and there it was shown that accidents on railways originate in three causes: these are, carelessness of servants—defective materials in the works of the conveying medium or the agent—and excessive speed. Of these accidents, about twice as many occur from collision between trains, as by running off the rail; and of these collisions, about five-sixths take place between passenger trains and goods trains, and only one-sixth by passenger trains running into each other. Not above one-twentieth have arisen from excessive speed, and in all these latter cases, they were caused by some imperfection in the railway. Most of the railway disasters were attributable to the crowding of trains timed for unequal speeds, and the want of punctuality; and to lessen the chances of these, powerful brakes for bringing up a train within the shortest distance had been used, but especially the road telegraph, that could announce the threatened danger along the whole line in a few seconds. Having these data before them, the enactments of parliament for the safety of railway travelling are such as

to meet every contingency, so that 200 of these apply to the London and North-Western Railway alone. And while the chances of danger have been diminished, the dread of them has abated. The weekly or even daily traveller can now inclose himself as confidently in the railway carriage that is to whirl him 500 miles along in the course of ten or twelve hours, as he would intrust himself to the cab that is to convey him a few streets off.

When this new mode of transit was adopted, the canals and public roads of our island had been brought to their highest state of perfection, and had given their best promise of future usefulness. But the new principle of motion had made them superfluous, and both mail-coach and track-boat began to be laid aside. Even for the conveyance of goods as well as travellers, the facility of the railway was preferred, and the wonders of Brindley and Macadam were forgot in the triumph of the Stephensons. An effort, indeed, was made in behalf of our canals so late as 1831, when a swifter mode of travelling upon them, by the use of light and sharply-modelled boats, was introduced by Mr. Houston upon the Glasgow and Paisley Canal. His experiments then showed, that passengers could be conveyed by this change at the rate of nine or ten miles an hour, and this without injury to the banks by such unwonted speed of canal travelling. But the universal impatience was too ardent for such poor progress, and few now travel by such a conveyance except invalids, or those with whom time is of little account. In the goods conveyance, they are also used chiefly for such articles as cannot well bear the expense of transport by the railway.

Having thus noted the progress and improvement of the means of comfortable living for the community at large, it is necessary to ascertain its practical results. In such a case, also, where the minutiae are familiar to the personal and local experience of every reader, we shall serve our purpose more satisfactorily by summing up the total of this experience in the general statistics of the present period with an occasional comparison with the past. In 1853 the population of the United Kingdom amounted to 27,500,000. But while this increase had gone on by the natural ratio, the produce of the wheat crops since the year 1760 had at least been quadrupled. For this population, therefore, which had little more than doubled during the interval, there had grown such an increase in the means of comfortable living, that the use of wheaten bread had become universal. Oats are now used almost wholly for horses, and barley for distilleries and brewing, while rye-bread is almost unknown. Of wheat and other grains,

and of pease and beans, the consumption in 1853 was about 49,000,000 quarters, and of these, 33,000,000 were used for the food of man alone, while of this human consumpt, more than one-half consisted entirely of wheat. Of these, the annual importations of foreign wheat after the restrictions had been removed, until 1852, had averaged somewhat more than 3,000,000 quarters, and during the last-mentioned year they amounted to 4,164,602.

The improved agriculture that had made our corn fields so productive was equally apparent in the rearing of our cattle, which, as butcher-meat, had increased in bulk, quality, and firmness, partly owing to the crossing of superior breeds, but still more through the improvements introduced into their feeding by the cultivation of clover, turnips, and mangold-wurzel. The consumpt of butcher-meat in London alone during the course of a single year may serve as a fair criterion for the United Kingdom at large. In 1852 the number of cattle sold in Smithfield was 256,948, of sheep 1,575,340, and of fatted calves, not including sucklers, 36,027. These in all were calculated as representing 297,071,530 lbs. weight, and, at the average price of 7d. per lb., would bring in money about £8,664,586. But besides all this there was abundance of hogs and pigs which were not taken into account. Much of this, indeed, goes from London to other towns and villages, yet from these as much butcher-meat is supposed to be imported into the metropolis in return. In this Smithfield report only the staple commodities of animal food are comprised; but the London annual bill of fare would be vastly augmented if we also reckoned the mountains of poultry and game, not to speak of fish, which are consumed by its 3,000,000 inhabitants. In passing from England to Scotland we find the increase of subsistence and improvement of diet still more remarkable. And here we have only to select Glasgow as the criterion. In that city, not only at the middle but even to the close of the last century, flesh markets were almost unknown, and the chief subsistence of families was generally a small cow or bullock killed and salted in November, which was made to last all the year. This is still familiar to the recollections of many in Scotland as the "winter's mart," which was the common resource over the kingdom. But in 1851 there were killed in Glasgow 29,569 oxen, 4443 calves, 123,188 sheep and lambs, and 5157 pigs, independently of the great amount of fresh and salted meats imported into the city.

In this brief enumeration it will be seen that for the 27,500,000 of the British population art and industry have done their utmost, and that for all there is food enough and to spare. But even at the most sumptuous wholesale feasts it will

happen, however plentiful the viands may be, that some of the guests have less than their share, and must depart almost as hungry as they came—that a competition will go on in the area for the fragments, and even a scramble under the table for the crumbs—and that a crowd of poor expectants who have waited on the threshold for their dole must betake themselves with a sigh to some more bountiful quarter. And thus amidst the growing and increasing plenty has it continued to be with the British community at large. Many toil for half a share, and many toil in vain; in some the enterprise is misdirected, and in others even the feeling of hunger is absorbed in a more prevalent indolence. Through fault or through misfortune "the poor shall never cease out of the land," let its abundance be what it may; and while the triumph of wealth is at the height the cry of destitution has waxed louder than ever. It seems, indeed, a necessary doom of national abundance to create and multiply its opposite, and the list of achieved fortunes to be balanced by an equal amount of deprivation. But while such a consequence would have been fatal to any other country, Britain during this period surmounted and is still able to surmount it by the numerous safety-valves she possesses in the form of colonies, in which the utmost of her poverty can find a home and sustenance, and the best of her unemployed energy an ample field of exertion. And it was well for our country that such lands of refuge had been in preparation for the coming of the evil day, and that they presented such scope for every variety of demand and occupation. In this way the younger sons of our aristocracy—men of noble name but scanty means, and who, but for such a resource, might either dwindle into tradesmen or degenerate into such titled paupers as are too often found in some parts of the Continent—can find civil or military appointments in our Indian empire sufficient for their necessities or even for their ambition. The man of small capital or of commercial talents and enterprise may become a sugar or cotton planter in the West Indies, or a comfortable landholder at the Antipodes. He who has no inheritance but a pair of broad shoulders or skilful mechanical hands knows that at the worst he has only to transfer himself to Canada, South Africa, or Australasia, where he will have not only the certainty of abundant wages, but the means of becoming a master instead of a workman, a landed proprietor instead of a ploughman. Even he who has consumed his last crust, and has no prospect for the morrow, can still at various ports find a vessel that will waft him free of expense to New Zealand or Australia, where the supply of labour is still the desideratum, and where, with moderate work, he may fare luxuriously

every day. These resources of emigration have been widely opened during the present period, and extensively used, not only on account of the facilities afforded for a transit to these regions at a merely nominal expense, and the speed and ease of the passage through the employment of steam, but also by the liberal institutions which the home government has granted to these colonies, so that a man finds himself as free a British subject at the other side of the earth as in the heart of Middlesex. Of the growth of emigration, therefore, during the present period, an idea may be formed from the numbers of emigrants during the three following years:—There were in

1831, ...	83 160 persons.
1841, ...	118,592 „
1851, ...	335,000 „

The consequence of such copious emigrational drains, which took place every year, was not only the immediate relief of the destitute, but a more abundant supply of work and wages for those who remained. These advantages have been especially conspicuous in Ireland, where they were most needed, from the continual overcrowding of the population beyond the means of subsistence, which was a fruitful source of anarchy, crime, and political discontent. In their case, however, the tide of emigration has been directed, not so much to our colonies as to the United States of America, which they seem to consider as their home next to their own island. The great emigration that took place from Ireland from 1846 to 1854, which so greatly alarmed our politicians, and threatened to depopulate the whole island, only redounded to its benefit by raising the wages and greatly improving the condition of the still abundant population who remained behind.

The immense number of emigrants in 1851, as compared with that of previous years, was the beginning of a new era in the history of British emigration. In our chief pastoral colony, Australia, many had become impatient of the slow progress of money-making as shepherds, and had betaken themselves to the gold fields of California, where fortunes could be made or hopes marred in the turning of a die. The report of the rich lumps of gold which were found in that quarter, was directing the new tide of emigration thitherward, when it was suddenly discovered that Australia possessed her gold fields as well as California, and of easier and more comfortable access. This discovery was first made in a district between twenty and thirty miles beyond Bathurst, a town about 125 miles distant from Sydney, and the honour of the discovery and its public intimation was due to Mr. Edward Hammond Hargraves. Beneath a soil so sterile that three acres were needed to pasture a single

sheep, masses of gold were lying within a few inches of the surface; the sands and the stones were impregnated with gold; whole rocks of gold lay buried beneath them, of which these were but the indications. A rush of the population towards Bathurst was the consequence, and the "Valley of Ophir," as the auriferous district was called, was soon covered with tents and filled with gold-seekers, while the fortunes that were realized caused the number of disappointments to be overlooked. But this success, instead of staunching, only whetted the general cupidity: there were ranges of mountains in the great Australian continent similar to the gold-producing ranges of California and Russia, and a short exploration sufficed to discover the hidden treasures of Ballarat, which were supposed to be tenfold greater than even those of Bathurst. This was enough to turn the tide in the direction of Victoria, hitherto only an offshoot of the parent colony of New South Wales: servants forsook their masters, shepherds their flocks, shopkeepers their traffic, in the new rush that took place, and in the turmoil all social order was unhinged and regular industry suspended. But it was not alone from the Australian districts that this concourse was gathered; the vessels that arrived were emptied of their crews, and officer and sailor alike hurried off to the diggings, leaving their ships unmanned in the harbour. From Australia the tidings were not long in reaching Europe, and while every town in Britain was infected with a mania for gold-finding, every European country caught the infection; and thus, the immense increase of emigration to these colonies which had commenced in 1851, the year of the discovery, was kept up for several years afterwards. Happily, however, after the gold nigh the surface was gathered, it was found that privation was to be encountered and toil endured, and the resources of science and skill tasked to the uttermost in winning these treasures as well as any other advantage, while the uncertainty was greater and the chance of failure more frequent. Accordingly, those whose impatience to be rich was not so ardent, or whose hopes were less sanguine, and those who had not strength, health, and nerve to endure the laborious ordeal of the diggings, returned to their regular employments, and left the gold fields to the superintendence of government, and the operations of practical scientific workmen.

Of the importance, however, of this great Australian discovery to the mother country of Great Britain, and the effects it is likely to produce on her enterprises of colonization and commerce, it is necessary to give a more distinct idea by arithmetical figures, rather than those of rhetoric. The annual supply of the precious

metals throughout the world is estimated at £47,000,000, of which their several sources and amount have been given as follows:—

From America, ...	£8,700,000
From California, ...	14,000,000
From Europe, ...	1,500,000
From Russo-Asiatic provinces, ...	8,885,000
From Australia, ...	19,000,000

In 1852 the yield from the gold fields of Victoria alone was 4,247,657 ounces, which at the low rate of 75s. per ounce, gives the amount of £15,928,714. It is well that this enormous increase, with which merchandise might have been flooded and swamped, was drawn off for other purposes than those of traffic, and in those of arts and ornament alone nearly one-half of the precious metals are absorbed or locked up. Even yet too the flow of gold, instead of contracting, is becoming wider through the recent discoveries of the auriferous sources in British Columbia, to which the gold-seekers who have been disappointed in other quarters are now directing their renewed spirit of enterprise.

The vast increase of wealth and population to our Australian colonies during this season of gold fever, although wonderful in the history of colonization, was nothing more than natural and to be expected. The cause was enough to attract myriads, not only from the mother country but from different parts of Europe, and even from China, whose inhabitants, setting at nought the prohibitions of their barbarous laws against emigration, repaired in great numbers to Australia. Strange therefore will be the blended population of all races which these colonies will exhibit a hundred years hence; and equally strange the blending of idioms, when this Babel of speech has subsided into one of the forms of the English tongue! It might have been thought that in a colony such as New South Wales, whose population was so largely mixed with convict materials, the first scramble of the discovery would have been accompanied with a frightful outburst of lawlessness and crime; but it is singular to remark, that the first eighteen months at the gold fields of Bathurst were unaccompanied with any remarkable addition to the criminal statistics of the law courts. Very different was the case at Victoria, to which the more reckless of the adventurers repaired, and where those who could not find gold for themselves were ready to snatch it from their more fortunate neighbours, or intercept it on its way to head-quarters. Of the amount of the emigration, an idea may be formed from the sudden rise of Victoria. In 1836, this Australian colony only commenced its existence. In 1851 its population had risen to 77,345 inhabitants, but in 1852, when the fields of Ballarat had been laid open, the population was increased

to about 200,000. In 1851 its revenue was £379,824, but in 1852 it was £1,576,801. During the latter year, fifteen steamers with emigrants arrived in the Australian ports, of which the greater part were landed at Melbourne. Since that period, the increase of Victoria has gone on so rapidly that it has about 500,000 of population; its imports are about £10,000,000 and its exports about £11,000,000; and it has an annual revenue of nearly £4,000,000; while its principal city, Melbourne, in 1857, numbered a population of 70,000, with 30,000 in the suburbs. Sydney, the capital of the mother colony, although now inferior to Melbourne, had in 1856 a population of 53,118; and while the luxuries and comforts of both are equal to those of London or Edinburgh, these cities possess a beauty of site, scenery, and climate, with which the capitals of our own country can scarcely compete. Besides these two colonies, this great island or continent has that of South Australia, rich in copper mines, and Western Australia, originally known as the Swan River settlement, which was established in 1829, the capitals of which are Adelaide and Perth,—and Queen's Land, a region of excellent pasturage. Out of the mixed population of Australia, considerably more than a million are of British birth or parentage, insuring the permanent establishment among them of Anglo-Saxon blood, language, and institutions. Who does not recognize in these, the germs of a future empire similar to that which we have planted in America? In this way, our several colonies in Canada, Australasia, and the West Indies are vast fields for British emigration as well as depôts for our future commerce; and in these her children, Britain may survive to distant ages when her own days are numbered.

From the emigrant experience which our country has been somewhat slow to gather, it is now generally understood that the weak, the sickly, the indolent, and that all of sedentary or literary professions can scarcely hope to better their condition as colonists. Strong arms; patient industry, and agricultural skill are certain to win their way to fortune; while the clerk or tradesman is at a discount, and even the Oxford student may starve, unless he can herd cattle or drive a dray. It was accordingly found in the reports of the late emigration commissioners, that for every single emigrant drawn from our six greatest manufacturing districts, four were drawn from six of our merely agricultural counties. But of all the communities who have departed from our shores, none have so greatly benefited as the Irish, whose sole possession and inheritance was the sad one of deportation. For them no work was too arduous, no fare too

humble, no difficulty too great; and in their new homes they roused themselves like giants from the sleep of years, and went onward with a dashing intrepidity and sturdy perseverance that outstripped their wondering competitors from England, and even from Scotland. A new life was opened to the delighted Hibernian when he found that he could actually become a man of substance; and he showed—what was more wonderful still—that he had the gift of discreet management about him as soon as he had something to manage. “In the United States, in Canada, and in Australia,” says Count Strzelecki, “I saw the Irish living as well as the Anglo-Saxons, acquiring their grumbling habits, and thus continually improving their condition.” But something more honourable still can be stated in praise of these Irish emigrants. While they were thus waxing comfortable and acquiring provident habits, they had neither forgot their former home nor the friends they had left behind them; neither absence nor prosperity had chilled them into selfishness, as is too often the case with other fortunate adventurers; and the first fruits of their success were transmitted to Ireland for the support of their starving kindred, or to furnish them with the means of emigrating to this land of promise, where they might become as independent and happy as themselves. But the amount of these remittances would be incredible were it not for the veritable source from which the information was derived. During the ten years that intervened from 1848 to the close of 1857, the sums thus remitted by Irish colonists, through the great commercial firms and banking houses, amounted to £9,937,000! or about £1,000,000 annually, independently of what was sent through other channels. This was the testimony given to government by these houses themselves, and from whom, in such evidence, no exaggeration could be expected. As long as Ireland possesses such noble hearts, the hope of her regeneration, in spite of the thwarting influence of priests and demagogues, may be cherished as a political certainty.

But alas that we must now exclaim, “Look on this picture, and on this!” We must turn from the Jove-like “presentment” to his brother—to him whom the same mother bore, and the same lap nursed, but only to blight the other, if not to drag him to destruction. While the march of improvement was thus going onward with such an accelerated speed, the multitudes who were left behind at every step continued to increase, until the benefits of progress itself seemed more than counterbalanced by the evils of which it had been directly or indirectly the cause. During these last thirty years, the cry of warning

and despair was loud enough to drown the jubilant shouts of triumph and self-gratulation; to excite alarm and provoke inquiry. And it was then found that beneath this alluring surface, a mass of popular crime and misery was festering that silently tainted the air with a deadly pestilence, and might at any moment burst forth with an all-overwhelming explosion. It was ascertained that a nation exhibiting the highest amount of virtue and intelligence also most abounded in the very extremes of these qualities, and that the height of national prosperity itself was the culminating point at which our swift and certain ruin was already commencing. Such was the intelligence conveyed by modern journalism, under which no individual however lowly can be unknown, or deed however secret concealed, and by which evils are explored, laid open, and denounced of which our fathers were contented to remain in untroubled ignorance. To these unwelcome revelations, which have awakened the benevolent inquiries and formed the perplexing problems of social science, we must now reluctantly turn: the subject itself is too widely known, and too deeply felt, to require either a lengthened or minute detail.

A fruitful primary source of these increasing evils was the defective system of education. While England was increasing in intellectual renown, by the master intellects she produced, and those improvements in science and literature by which the world at large was benefited, the fact still continued to exist, that she was the only civilized country that had no national system of education. We have already, more than once, alluded to the struggles which were made to repair this evil, and the causes from which the attempt was frustrated. No sooner was the proposal started than the religious jealousies of all parties were awake, and a uniform state education was found as hopeless as a uniform state creed. As a consequence of this, it was ascertained by calculation that even during the latter part of the present period there were nearly 8,000,000 of our population who could neither read nor write. These, too, did not consist exclusively of the poorest classes, as many of our farmers were under the same intellectual destitution. Of the character of our education, that of the upper classes was reckoned the best in Europe. This indeed was nothing more than might have been expected, on account of our richly-endowed universities, our public libraries, and the liberality of our aristocracy, who were willing to bespeak the best instructors, whether native or foreign, at any price. Of the middle and mercantile classes, it was found that the education was decidedly defective, even as compared with that of other countries, having more show than

substance, while the schools were rather cheap or comfortable boarding-houses than strictly educational institutions. For a still lower grade of society—that of shopkeepers and thriving artisans—the education was generally found of a more substantial and practical character, especially in town and city day schools; but this advantage was counteracted by the shortness of time given in the attendance of their pupils, who in early life were generally sent to learn a trade. But last of all were the schools for the masses, which were as defective as such institutions could well be. The teachers were seldom even half educated, consisting generally of the lame, the sickly, or deformed, who could not obtain a living otherwise; of the indolent, who thought that doting at a school-desk was more pleasant than handling a spade; and of broken-down tradesmen, who were good enough to manage a school, as they could manage nothing else. The school-room in the country was frequently an uninhabitable hut, and in the town, a chilly or ill-ventilated apartment; while both in town and country the children were so crowded together, that mutual sickness rather than mutual improvement was the usual result. Such were the generality of schools for male and female pupils of the lower classes throughout England and Wales; and where better buildings might have been erected for the purpose, and more efficient teachers appointed, these purposed improvements were frequently marred at the outset by the political and sectarian jealousies of the parents. And while from these several causes not one-half of the children of England and Wales, between the ages of five and fourteen, attended any school whatever, the education at these humble academies was of the most scanty and unsatisfactory description—a little reading, writing, and arithmetic, picked up in the midst of the confusion as they best might—while in the schools of a better class, also, these composed the whole curriculum. It was only in going higher still—to the costly academies and institutions of the mercantile and middle ranks—that these were found mixed with a modicum of geography, history, science, music, and drawing.

While the general education was thus so far short of the advance of the age, that it only perpetuated the old established ignorance, and increased the dead weight that was gathering at every step of progress—and while this ignorance multiplied crime, and increased the popular envy and discontent of the lower against the higher classes, there was another national evil by which the ranks of the lower classes were fearfully multiplied, as well as their condition sunk lower in the social scale. This was the manner in which land is tied up by entail, and the conse-

quent difficulty of selling or alienating it. As the privileged class of landholders continued to die out, their estates, instead of being thrown into the market, continued to accumulate in the hands of the survivors; and in consequence of this feudal fatality, shopkeepers, farmers, and thriving peasants were prevented from purchasing a few acres, and planting their families among the independent landholders. From the same cause, which converts small farms into large ones, the peasantry are shut out from the chance of rising into farmers. And thus our brave-hearted, independent, comfortable yeomanry, once the pride of England and its best defence, have almost disappeared from the country which they served so well. We are told that in 1770 there were not less than 250,000 freehold estates belonging to as many different families. In 1815, at the close of the French war, this number had diminished to 32,000. And yet there was no natural necessity for such decrease, as in 1847 there still remained about 11,300,000 acres in England wholly uncultivated, but capable of cultivation. And with our yeomanry, the healthy, cheerful, out-door sports of “merry England,” the games of cricket and football, the shooting-matches, running matches, and village dances have departed. Near our large, and especially our manufacturing towns, hedges are broken through, the grounds trampled down, and fruit-trees destroyed, especially on Sundays; and hence the necessity of high walls and fences, by which the walks of the working people are confined to narrow dusty roads. The commons and public village greens have been inclosed, and the games that enlivened them excluded. Thus circumstanced, the peasantry of England have few places of relaxation except the village ale-house, in the stimulants of which its frequenters drown the sense of their depression, until they become confirmed sots and drunkards. There also the village *quidnuncs* hold their treason clubs, listen to demagogues who indoctrinate them in the principles of chartism and socialism, and are trained for every change of political outbreak, from simple rick-burning up to a national revolution and agrarian spoliation. And as it is necessary for such an idle improvident course to have the means of ale-house indulgence, they there concoct their plans of poaching, house-breaking, theft, and highway robbery, by which they are enabled to act out their chief principle of “a short life and a merry.” It has been always thought that a country life, even at the worst, was less depraved than a town one; but recent investigations have shown, that in England at least the amount of crime in the agricultural counties is scarcely inferior to that of the mining and manufacturing districts. This was

proved by Lord Ashley from the statistics of the years 1841 and 1847. In passing from the rural to the civic sources of demoralization, we find that these, both in number and character, are adapted to the several divisions of the lower classes, and the multiplied cravings of artificial city life. The chief of them are low theatres in which Jack Sheppard morality is taught; fairs, and dancing taverns, which last are also frequently brothels; and in all of them the young of both sexes are trained by regular steps from the mere theft of a penny, the price of a theatre ticket, to iniquity upon its most daring or complicated scale. Then, there are gin palaces by the thousand, where small measures of the ardent spirit are sold at a low price to suit every grade of boyhood; and the shops of dealers in marine stores, where every kind of stolen goods are received, prompt payment given, and no questions asked. Of a somewhat higher class, and externally more decorous, though perhaps scarcely less corrupting, are the casinos, mask-balls, tavern-theatres, and betting clubs, with which our principal cities abound—and to these may be added the low horse-races that congregate the lawless population both of town and country.

Into the details of pauperism and moral depravity produced by such a state of things we have no desire to enter. We can only touch upon the generalities of such a subject, and yet their slightest disclosure is enough to produce a recoil of terror and disgust. Such was the increase of poverty during the present period, that in 1848 the number of paupers relieved by the boards of guardians amounted to 1,876,541 in England, or about one-eighth of the whole national population, independently of the hundreds of thousands who were relieved by private charity. Of the homes of such myriads of the destitute—whether in town or country, whether permanent residences or temporary lodging houses—their unhealthiness and discomfort baffled all description. But this was not the worst. Where people were crowded by tens, and even by twenties, into a single apartment, without distinction of age, sex, or character, the moral atmosphere of such a sty became more pestilential than the physical, and not only the crimes incident to such a state of living were unblushingly and openly prevalent among them, but those outrages against natural feeling which every community has doomed beyond reprieve. What could be otherwise when brothers and sisters, when parents and children, hardened to every moral feeling and ignorant as the brutes that perish, lived night and day huddled within a single room? Such a state of things was revealed by the investigations which were set on foot as would have been incredible of the lowest stages of barbarism and the darkest

epochs of society, far more of England itself, and the middle of the nineteenth century. It was a natural result of such promiscuous living, mixed with such squalor, destitution, and gross dissipation, that 60,000 still-born children (happier than those who survived) should be annually brought forth throughout the kingdom. It was also a natural result that the infants of such parents should be little prized at their entrance into life, and regarded as incumbrances and curses rather than blessings. Accordingly, society was suddenly startled by the revelation that infanticide had become an English crime, and was prevalent in the midst of us. Parents enrolled themselves in burial societies with a perspective view to the profit which they meant to realize upon it, and the infant, as soon as born, was deliberately doomed to death by the mother for the sake of the burial fees. A few drops of laudanum silenced the innocent victim for ever, and the price of its life furnished the means of more ample household comfort, if not of gross revelry and indulgence. In this way, parents could calculate upon their own children, as the farmer does upon his sheep for the market or the shambles. It was a crime which no statistics could reach, and no surmise could be made of how many hundreds or thousands had thus passed through the fire to Moloch before the alarm was given, and inquiry set upon the alert. It was indeed full time that the registration of every birth and death, under whatever circumstances, should be imposed as a universal duty, and a strict compliance with it enforced under heavy legal penalties.

While such had been the progress of secret and unpunished crime, the amount of open offences against the law, and the number of convictions, instead of being stationary, had continued on the increase. This is apparent by a comparison of the statistics of 1817 with those of 1857. During this interval of forty years, the population of England had increased from twelve to twenty-one millions, while the increase of our criminal calendar was more than doubled. Thus there were in

1817—Convicted, 911	Sentenced to death, 911	Executed, 78.
1857 " 2057.	" 21.	" None.

It will be seen from the merciful character of the last year, that our statute-books had been revised, that a reaction of clemency in favour of our criminals had set in like a spring-tide—that the punishment of death had been all but discontinued, while transportation, its milder alternative, had been abolished. The same tables also show, that convictions for crimes accompanied with personal violence had very greatly increased. There were—

	Year 1847.	Year 1857.
Stabbing or wounding, ...	26	308
Robbery, ...	184	378
Burglary, ...	374	473
Housebreaking, ...	153	568
Larceny in dwelling-houses, ...	148	246
Forgery, &c., ...	62	184

It was fortunate in such a state of things that the sharp spirit of inquiry was on the alert—that the means of publicity were so perfected—that zealous philanthropy was alive and ready for action. Public crimes might be dealt with by the law; but there was a whole world of offence lying beneath them which justice could not reach unless our free constitution had been subverted. First to check, and finally to eradicate this foul leprosy which was rooted so deeply and spreading so fast, must be instantly commenced, for the life of the whole community was at stake. Parliament accordingly interfered with enactments, and societies and associations were formed for the suppression of vice, the relief of destitution, and the moral and intellectual improvement of the lower orders. Never was “social science” so anxiously studied, never was British benevolence so active, so liberal, so self-sacrificing; and if anything can mitigate the horrors of the view, it is to be found in the benevolence that applied the remedy. The lowest depths of society were laid open, and a hell disclosed of crime and suffering over which the nation had been hitherto reposing in peace. But even into that murky abode Christian charity could enter to reform and regenerate. The plans for the benefit of the lower orders, although they form so distinguishing a characteristic of the present period, are yet so numerous, that to only a few of them we can afford a passing notice.

For the poorest of the poor the means of emigration have been multiplied both by government and colonial bounties; and those who are willing for work but unable to find it, may obtain not only a free comfortable passage to a new home, but profitable occupation there to the full, and in many cases a grant of land sufficient to establish them in honest independence. But as too many have neither enterprise nor industry for such an easy venture, or are too closely wedded to their old haunts and dissipation, means are adopted either to allure them from their vagrant profitless life, or compel them to respect the decencies of society. Their steps are watched, and their domestic economy controlled by a stricter surveillance. The wretched lodging-houses in which they congregated, and where they defied all law and common decency, have either been removed, or compelled to take out licenses, by which they are regulated as to their means of health and comfort, and the behaviour of their inmates. The narrow closed courts of

towns, among whose swarming families life was smothered and pestilences engendered, are opening to the air of heaven and the light of day. The sanitary regulations imposed upon these localities have been so many and minute, that diseases among them are neither so prevalent nor so infectious. With light and air, water has been more abundantly introduced, and thus personal cleanliness may be made the stepping-stone and commencement of a moral reformation. Piles of new houses are rising in our towns, expressly built for the accommodation of the poor, in which a small rental is required by such means of comfort and even of neatness, as the habitations of earlier erection for the better classes can seldom exhibit. Nor in this enumeration should we forget the public fountains, which are rising in every street, and at which the wanderer or labourer can comfortably quench his thirst, without the necessity of repairing to the gin palace or ale-house. The church accommodation for the poor has been increased; humble places for public worship opened; sermons expressly suited to the lowest of the destitute prepared, and open-air preaching more extensively practised, so that every shade of ignorance or vice can find its appropriate instruction, and every kind of threadbare or ragged clothing a place in which its wearer may appear without diffidence. It is significant of these religious agencies, that even our church dignitaries, who formerly scowled at them as ecclesiastical irregularities, are beginning to take part in them. For the children of such parents, also, ragged schools have been established, where industrial habits along with a good sound education are carefully inculcated; and going lower still, we have reformatory schools, where the young, already depraved, are broke in for the ragged school; and reformatory prisons, out of which the culprit may depart a wiser and a better man. In this way, strong, sharp, heavy utensils are breaking and delving into the deepest stratum of society, to reconstruct and strengthen the yielding foundations of our social edifice. Much indeed has to be done; but even already much has been accomplished, giving promise of better days for Britain in the good work of moral regeneration and advancement.

But the co-operation of the people themselves was most needed; an act of *self-reformation* was demanded, by which they should voluntarily combine for the improvement and elevation of their own order. For centuries the vice of drunkenness had been reckoned the chief of our national offences, the fruitful parent of more than the half of our social evils; and until this was abjured, it was felt that every moral appliance would be only a superficial or temporary remedy. And that the stigma which was branded

upon our national character had been too justly merited, a brief retrospection through the whole range of our national history will sufficiently confirm. It was the master-vice of the northern races from whom the greater part of the European nations were derived; but while the continental nations had outgrown this evil tendency of their fathers, it had continued to flourish in insulated Britain unmitigated and unchecked; so that even during the reign of the two first Georges, foreigners had been scandalized, when they visited Britain, with the spectacle of drunken peers, flustered clergymen, and thriving merchants who hiccupped in their speech when the hours of 'change were ended. The reformation, indeed, of this general evil had commenced, as it ought, among the upper classes; but it was not till the beginning of the present century, that to be "as drunk as a lord" was a comparison that could no longer hold good. It was only then that the vice had become unfashionable in the higher ranks, and discreditable among the mercantile aristocracy—that, under the influence of nobler aims, and a keener struggle in the contests of wealth or ambition, the better classes had freed themselves from the long-established tendency. But the demon, thus driven from high places, took a closer shelter in the lower, where, from the causes already mentioned, his hold became more general and more inveterate than ever. When the bulk of destitution and crime had increased through this evil alone to an amount beyond what society could endure, a remedy was sought, but was long in finding. Could the ignorant, the destitute, the despised, be weaned from drunkenness, as well as the rich, the noble, and intellectual? The trial was made, and near the close of the last period the Temperance movement commenced. This was followed by the preaching of Father Mathew, the apostle of the enterprise, and hosts of coadjutors whom his example inspired. A regular crusade was thus commenced against the popular iniquity; the resources of the platform and the press were plied as strenuously for the moral, as they have been for political reform; and temperance societies were established throughout England, Scotland, and Ireland, whose members were soon numbered by tens of thousands. It had been discovered, also, that for a complete emancipation from the evil habit, the mere principle of temperance was insufficient; total abstinence therefore became the rule, and "touch not, taste not, handle not," the motto of the movement. It was thus alone that the confirmed drunkard could be reclaimed from his habit, and the weak and wavering from the temptations attendant upon friendly meetings, social feasts, and public merry-makings. In this way, the word "temperance" was made to assume a teetotal meaning. The

progress of this great collective movement during the present period of our history has been wonderful, although at first it was reckoned the most hopeless of all enterprises; and its success continues to be shown upon the thousands whom it has reclaimed from confirmed intemperance, and the myriads whom it has arrested on the threshold, and to whom it has proved an effectual monitor and safeguard. Its societies are felt to be cities of refuge, to which the proscribed drunkard can flee and be safe; and where his resolutions of amendment are strengthened an hundredfold by the new community into which he is welcomed, and the *esprit de corps* by which his future course is regulated. Let but this progress go onward as it has done, and the Temperance League may yet prove one of the most effective of all our social and moral reformers.

While such are the means employed upon that huge mass of our population which constitutes the lowest of our lower orders—so debased in its guilt, and so terrible in its brute force should it break loose—those which were devised for the orders immediately above the lowest were of a more intellectual character as well as earlier application. And first of these may be mentioned the exertions of the Press, which, at the commencement of this period, were chiefly impersonated in the "Society for the Diffusion of Useful Knowledge," and the publications of which were intended to form a cheap but complete library for the working man. Then issued those serial works which appeared in cheap weekly numbers, the *Penny Magazine*, the *Penny Cyclopædia*, *Chambers's Journal*—works which, notwithstanding their humble appearance and aim, had for their contributors men of such high mark in literary talent and reputation as formed a guarantee for their usefulness as well as promise of success; and these works, which were circulated among our working classes in hundreds of thousands, conveyed lessons in every department of science, literature, and general knowledge under their most intelligible and attractive forms. Even the fine arts also were not neglected in these penny publications, and the sums expended upon the pictorial illustrations of the first and second of these works were to an amount greatly beyond any that had hitherto been bestowed upon the costly publications which had been only within the reach of the wealthiest. It was soon found that a new impulse had been created—that the demand for such productions would not only defray the large expenditure, but secure a good mercantile profit—and a rush of serial publications followed, of which the *Penny Magazine* and *Penny Cyclopædia* were the exemplars, and in which such an amount of useful talented writing and highly-finished artistic engraving was con-

tained, as fifty-fold the amount of their price could not have previously purchased. It was a new temple of knowledge opened to the multitudes, of which the opening of the Crystal Palace that followed was nothing more than the natural sequel and consummation. The impulse of cheap publishing was extended to other works that hitherto, from their cost, had been sealed books to the multitude; and the writings of our best theologians, historians, poets, novelists, &c., were reproduced at a rate that made them accessible to all but the very poorest; so that the humble artisan could now afford to purchase such a library as none but the rich and the learned could have procured only a few years earlier. Indeed, none had now to remain ignorant and untaught but those who obstinately willed to be so. This expenditure in cheap books, also, instead of impoverishing seems to have enriched the purchasers, by introducing among them a more active industry and more provident economical habits. This was shown by the fact that £33,000,000 sterling lay deposited in the savings' banks, and that penny savings' banks were established as feeders to the former, and for the accommodation of those who could only deposit copper instead of silver. With the diffusion of literature and science by means of these cheap serial publications, it is interesting to mark that those connected with religion and morals had received a fresh impulse, and were keeping pace with the serials of a more light or alluring character. It was a hopeful proof that the public mind had been opened to something higher than mere literary amusement, or even intellectual instruction. Of the religious periodicals seventeen of the most popular have a circulation of 900,000. The tracts and other works of the temperance societies circulate at the rate of 300,000 weekly. The effect of all this reading upon the public mind is perceptible at a single glance. The trashy tales filled with silly romance and sickly German sentimentalism, which formed the light literature of the middle and lower classes, have disappeared. The more grave political works, by which they were taught to be discontented with their condition, and to look for no relief except in anarchy and revolution, have been thrown aside as waste paper. Those indecently immoral works and their vile embellishments, which found such an unblushing and profitable sale among our neighbours the French, and which threatened during the earlier part of this century to establish a footing among ourselves, have been so utterly discountenanced and put down that the greater part of society is ignorant of their existence. Even those flippant infidel writings of the Voltaire school, with which our literature was formerly inoculated in con-

nection with French immorality and French politics, are old-fashioned or obsolete; and, if a champion of unbelief puts forth his doubts, he knows that jesting will no longer serve for proof, and that his arguments will be subjected to a severe and sifting scrutiny. Works of a similar but less flagrant character—the Grub Street literature of the nineteenth century—have been driven from the middle to the lowest circles, where this abortive literature can scarcely secure its hold, or save itself from utter bankruptcy. While thus the course of reading has been so greatly changed, the intellectual character of the working classes has been elevated into a higher sphere. Let but a prize essay be announced for their competition, and who would judge that the articles returned were the productions of common workmen? And how would it have fared with such a trial half a century ago?

When we advance a step higher, and transfer our inquiry to the middle classes, we shall find that there also the same regenerating process has been going forward. This has been especially the case in the important matter of Education. From the want of a national system under the control of government, those who established themselves as preceptors were free so to do at their own good pleasure, and hence the strange instructors under which the boyhood of the present generation was in many cases nurtured. Our countrymen seem to have found out at last that, even if "reading and writing come by chance," the capacity of teaching these necessary branches is not thrown into the bargain, and that to give instruction is more difficult than to receive it. It was necessary, in the first instance, to teach the teachers, and establish such normal schools as had been set up in those countries where education is under state provision and government. Normal schools have accordingly been established in Britain, by which the standard of a common education has been raised, and its character improved, and where teachers for every department can be as carefully trained as the apprentices of any other trade or craft, and afterwards promoted according to their proficiency. It is true, indeed, that still we have scarcely a fourth part as many of these normal seminaries as one of the countries of Western Europe, and not a fourth part as many as are necessary to educate a sufficient number of teachers for the lower classes. But the reform commenced has been in the right direction; and, instead of complaining of the scantiness of the supply, we should rather congratulate ourselves that, in so short a time, so much progress has been effected. With instructors thus prepared, we have only to take into account the government schools already established, and the government inspectors who superintend them, to be

convinced that, although at a late hour, the reaction has commenced, under which our poor will at least be as well educated as those of other countries, and even the middle classes be able to vie in acquirements and general intelligence with the highest. With these educational appliances, which have chiefly reference to the young, we may take into account the numerous successful plans now in operation by which every class from the middle to the lowest is reached, and that tend to their general elevation and improvement. Among these we can only mention philosophical institutions, mechanics' institutions, lectureships for artisans, apprentices, &c., libraries and reading rooms, musical and art associations, for the most part supported entirely by the members themselves, and indicating in their encouragement and multiplication the benefits they have already imparted and the hopes they have inspired. Even the associations of certain London ladies for the improvement of the art of cookery, and the circulation among the lower classes of the best and cheapest modes of making good dishes, is a substantial sign of the true spirit of improvement. For where could reformation better commence than in domestic life, and amidst the enjoyments of a comfortable home?

In turning our attention to the progress of Science during the present period, we are at once arrested by the most wonderful invention of the day—that of the Electric Telegraph. Vapour had already been converted into the mightiest of mechanical forces, and gas into artificial sunshine; but it seemed the strangest achievement of all to manufacture lightning, and employ its speed for the conveyance of human thought. To what individual, or even to what country the honour of such a stupendous discovery is due, cannot be ascertained; and it has been claimed successively by Englishmen, by Germans, by Americans, by men of almost every country of Europe, who have all successively experimented upon this mode of communication, until the whole has terminated in the perfected telegraph of the present year. It thus resembles the art of printing or the manufacture of gunpowder—a hint or an idea started by we know not whom, but when once suggested, eagerly laid hold of, and acted upon simultaneously in different quarters, until an agency is matured by which the whole world may ultimately be brought into close communication.

After many experiments with the different kinds of electricity, it was found that the voltaic was the best, as being the most easily insulated, and therefore susceptible of the greatest range in its transmission. The voltaic battery, which is the agent of transmission, is of simple character, consisting of a series of pairs of plates of dissimilar metals, with a solution of acid and water, and

on making metallic connection between the plates, the electric current is immediately produced, and is transmitted to the distant station, where it produces the signals. Sometimes, instead of a voltaic battery, the power of a magnet, operating on a coil of wire, is employed to produce the current, and this is the agency employed in the magnetic telegraph. But whether the battery or the magnet be employed, the first and most obvious step was to establish the telegraph along the railway lines, and this has been done by the wires which accompany every railway. But such a means of correspondence could not long be confined to railway lines, and accordingly connecting wires began very speedily to branch off from the iron roads into the inland localities, until town was linked with town, and village with village, by a network of telegraphic wires that extended over the whole island.

This was much, but still not enough for Britain, whose greatest interests lie beyond her own shores. It was necessary for her welfare, that the extent of her telegraphic communications should be equal to the range of her commerce, and the remoteness of her colonial possessions, so that she might as freely communicate with the great cities on the Continent, and her settlements in the four quarters of the globe, as with her own towns and districts. But could the mysterious emissary pass through the ocean depths as well as over rocks and mountains? At an early period in the invention of the electric telegraph, the possibility of transmitting the voltaic current under water was the subject of study in India by Dr. O'Shaughnessy, and to the success of his experiments in the river Hooghly in 1839 the merit of the discovery has been generally assigned. It was found that the resistless power could pass onward unchecked through the water as well as through the earth and air, and that nothing would be needed except such tractors as could resist the corrosive agency of the water, or the submarine rocks and sand with which they would be in contact. To make subaqueous conductors was therefore the next attempt, and this was accomplished without much difficulty. These submarine cables for international communication where the countries are separated by the sea, consist of a core of copper wire surrounded by gutta percha; and the rope thus formed is surrounded and finally cased with an armour of stout iron wires. With these protections, a cable of the requisite length is extended from bank to bank, or from shore to shore, conveying state secrets or commercial tidings as safely and rapidly as the wires along the railway. The progress of the discovery, and the uses to which it was turned, were commensurate with its importance, so that before June,

1854, such connecting conductors in the form of wire ropes were laid between Dover and Calais, between Dover and Ostend, between Dublin and Holyhead, between Donaghadee and Portpatrick, and between England and Holland, and Denmark, New Brunswick, and Prince Edward's Island, and Piedmont and Corsica. The last great attempt, which was to connect Britain with the United States of America by a gigantic submarine cable extending across the Atlantic, has indeed proved a failure, but hopes are still entertained that this will be ultimately accomplished.

The form of writing in which the messages are conveyed by the electric telegraph has been not the least difficulty of the invention, the aim being to discover a kind of short-hand or cypher that could be quickly noted and easily read off; and after many experiments, three different plans were matured, which have now come into general use. The first of these in priority of time, was that of Professor Wheatstone and Mr. Cooke, of which the first trial was made on the 25th June, 1837, and is commonly called the "needle instrument." It is founded upon the principle of the deviation of the magnetic needle when under the influence of the electric current; and the operation is performed by one or two needles, by the movements of which the letters of the alphabet are indicated. The message thus expressed is read at the rate of from twenty to forty words per minute. This kind of needle-telegraph is the one most used in England and Scotland, over a compass of about 25,000 miles of wire. But that which is most extensively used, both on the continent of Europe and in America, is known as the Morse telegraph, and operates on the principle of electro-magnetism. A small lever, attached to the armature of an electro-magnet, is attracted at the instant that the current is transmitted, and the signals are given by means of the "clicking" sounds which it produces in its alternating movements. Formerly one end of the lever was made to produce a series of indentations upon a slip of paper, and hence it was termed the "recording instrument;" but this method is now generally abandoned in favour of the system by sound. By a third method, known as the "type-printing telegraph," the motions of the lever are so connected with an intricate system of mechanism that the message is actually printed, as it arrives, in Roman letters. A fourth plan, called the "chemical telegraph," was the invention of Bain, an obscure clockmaker from Watten in Caithness, and is founded upon the principle of electro-chemical decomposition, a mark being produced by the point of an iron stylus on chemically prepared paper at the instant of the transmission of the successive waves of electricity from the distant station.

The same wondrous power of the electric agent in writing and printing, irrespective of its benefit of swift transmission, was found available for the service of the fine arts. We allude to the art of Electrotypes, which was invented less than twenty years ago by Jacobi, a Russian, and Spencer, an Englishman, simultaneously. The processes by which it works are both delicate and numerous; and therefore we shall state, in general terms, that the agent employed is a voltaic battery, which operates by precipitating a metal in chemical solution upon a given object: the metal so dissolved, and applied in a continuous layer upon the object, may be made to adhere, in which case it supersedes the old processes of plating and gilding; but when applied without adhering, it gives an accurate likeness or facsimile of the surface on which it is laid. In this manner, it produces exact imitations of coins and medals, copies stamps, seals, and plaster casts, imitates fruits and vegetables, casts moulds for the foundry, and reproduces printed characters, copperplate engravings, wood-cuts, and daguerreotype pictures. The first use of it made in England by Mr. Spencer was in letterpress-printing, and this appears now to be one of its most valuable applications; but the principle once obtained, suggested many other purposes to which the electrotypes might be applied, and the processes accordingly became more complex and refined, until the reproduction of the highest works of art in sculpture and engraving was the result.

While the lightning has thus been converted into a letter-writer, courier, printer, and engraver, the sun, by an almost equally marvellous process, has been transformed into a draughtsman and portrait-painter. That beautiful invention, the camera obscura, had long been known, by which the scenery of a whole city or landscape could be collected together by a skilful arrangement of lenses, and reflected in all its brightness and distinctness upon a whitened surface, within a darkened tent or apartment. By this aid, the artist or the traveller had steadily before him the objects he wished to delineate; and he knew that a transcript of these, as they presented themselves in the condensed resemblance, would be more faithful to the reality than the artistic copy taken from the original itself. But these beautiful pictures, and the living moving objects with which they were animated, were like shadows upon the wall—they disappeared with every change of light and shade, and left no trace behind them. Could they not be arrested in all their vividness, and stamped upon the receiving surface into a permanent painting? The possibility of effecting this was first suggested by the blackening of salts of silver, as in the case of

those fluids used as marking-inks, and the permanent writing they impressed on linen or cotton cloth; and the hint thus caught, was improved into the invention of Photography.

Of the departments of this art, the first place is due to the daguerreotype, so called from its inventor, M. Daguerre, a Frenchman. After experimenting upon the subject for several years, he announced his discovery to the world in 1839. By it, a surface of pure silver being caused to combine with iodine and also with bromine, a delicate film is produced on the surface of the plate, extremely sensitive to light, and capable of retaining every image impressed on it. This was the first principle of the invention; but the delicacy and durability of the impression depend upon subsequent preparations too numerous and too minute to specify. This was much; and the first daguerreotypes that were produced were gladly welcomed as the beginning of a new era in pictorial art. But when the costliness of the material and the difficulty of the process would have checked the multiplication of these sun-pictures, it was discovered that other substances were capable of being so impressed; and the calotype, otherwise called the talbotype, from the name of its inventor, Mr. Fox Talbot, came into general use. By this plan a card or sheet of paper, or plate of glass, after undergoing a certain preparation, and being sensitized in a bath of nitrate of silver, could receive and retain the image in the camera obscura, and be capable of producing copies of itself. Such were the origin and first principles of those two forms of photography, the productions of which are now so numerous as to be found in almost every house, and which possess a fidelity of resemblance to the original, and a delicacy of execution, which leave the efforts of the painter and engraver far behind. The value of the invention, not only for its own productions, but as a powerful auxiliary to the fine arts, was speedily discovered; and photography, recognized as a separate art, has been yearly improving both in its processes and its productions. Briefly we may state, that these improvements resolve themselves into the following heads: 1. The preparation of the sensitive surface; 2. Its exposure to the image sought to be impressed upon it by the camera obscura; 3. The development of the image by chemical appliances; 4. The fixing of the image by dissolving out the sensitive surface, so that the light shall no further affect it. But it is not merely as an aid to the arts of sculpture and painting, or as a cheap ready substitute for their costly productions, that photography is a useful invention. By it the astronomer has already done something, and may hope to do more, in producing pictures of the phenomena of

the heavens in all their transient aspects and revolutions. By it the meteorologist can secure a register of the minutest changes of night and day. By it the lecturer and schoolmaster can exhibit the faithful transcripts of those objects which mere language would be insufficient to describe. By it even justice can arrest the fugitive criminal, by sending forth veritable copies of his likeness, instead of the vague or equivocal descriptions which were usually contained in the printed hue and cry.

Among the physical sciences, in which such advances have been made during the present period, Chemistry occupies the foremost place. Nothing less than this could be expected, when the materials of its study are the air we breathe, the food we eat, the liquids we drink—the elementary bodies in their simple or compound state, by which abundance, health, and comfort are secured, and sickness and pain averted. And yet, for thousands of years men were contented to follow what was blindly called the law of nature, and apply its rules without knowing why or wherefore; until towards the close of the last century, when the characteristics of the elementary bodies or simple substances which enter into the composition of what we see around us were heedfully investigated and classified. It was only then that chemistry was resolved into a regular science, and studied with a due appreciation of its importance. The revelations with which this search has been rewarded are now being turned into daily account, by an infinity of ingenious processes, from the manufacture of the finest pigments to the baking of a loaf. But British research would not rest contented with the mere honour of discovery, or the gratification of an intellectual curiosity; and hence, every important new result to which its inquiries have arrived, has been combined with the *cui bono?* The satisfactory answer has been given in the operations of bleaching, dyeing, and calico-printing, by which the value of our commercial commodities has been so greatly enhanced; in the preparation of gunpowder, salt, drugs, soap, paints, perfumery, &c., and in the manufacture of porcelain, pottery-ware, glass, paper, &c. In the improvements which are daily taking place upon these articles, the eminently practical character of British intellect has maintained its wonted ascendancy, while the world at large has been benefited by the fruits of this idiosyncrasy.

It is not, however, to our manufactures alone that the discoveries of chemistry are applied. The necessities of a growing population, the desire of profit, even the honourable ambition of producing a blade of corn where none grew before, have turned our national energies to improved modes of Agriculture, and the effect has

been exhibited in the reclaiming of waste lands, and in more abundant harvests from the fields where the old processes of cultivation have been superseded by the new. The agriculturist has now been taught that vegetation is a chemical as well as a vital process—that the vegetable world has life as well as the animal. A still more difficult task which he has to learn, is the selecting and apportioning of the different kinds of the plant-food to the nature of the soil and the vegetation that is to be sustained on it. And then, again, when a soil is exhausted, he must be skilful in the application of those particular kinds of manure which are suited to its nature and condition, and the best fitted for renewing its strength and restoring its nutritious properties. Thus, the farmer can no longer plant and sow indiscriminately, or according to his own wishes, or scatter the manure-heap at random; if he intends to pay the doubled or tripled rent of his acres, and have a comfortable reversion, he must abandon that slothful world-wide adage, “our fathers did so before us,” and cultivate his fields according to the new rules and processes by which the whole system of agriculture has been revolutionized. He has thus become in some degree a chemist without knowing it; and a skilful employer of its materials, without learning their Greek names, or subjecting them to a scientific analysis. But he knows that his ground yields thrice the amount which it vouchsafed to his grandfather, and that this increase has been owing to the introduction of those changes which his grandfather would have scorned as new-fangled, or condemned as a distrusting of Providence. The same redundancy of a growing population, which compels the Chinese to girdle their mountains with terraces, cultivate every inch of soil, and treasure up every particle of waste matter for manure, is apprehended also for Britain; but to encounter this emergency, the well-tried energy and industry of its children are aided by the rich resources of chemical science, under which the rock itself is becoming a yielding soil, and the morass a dry fertile territory. The renewal of an exhausted soil, and the production of a profitable rotation of crops, are now the most important questions in our new agricultural science; and the creation of artificial, as well as the improvement of natural manures, with the best adjustment of them to the particular soil and season, are the lessons chiefly studied by the young farmers of the present day. Of these artificial manures which have been largely used in modern agriculture, directed by chemical science, the principal have been kelp or barilla, guano, bones or bone-dust, sulphate of lime or gypsum, nitrates, potash, and lime. For the further fertilization of our fields, and the still greater increase of their produce, a question is

now at issue, in which the interests of British agriculture are deeply involved—we mean the conversion of the sewage of our cities into manure. The condition of the Thames at London, and of the Clyde at Glasgow, and especially the state of those inland towns where no neighbouring river can be converted into a drain and common sewer, has arrested the general attention; and chemical research is actively employed about the best means for deodorizing this sewage, and converting it from an increasing source of miasma and pestilence into a means of agricultural abundance.

In the science of Astronomy, England has not been unmindful of her distinction as the birth-place and home of Sir Isaac Newton; and the discoveries of Sir William and Sir John Herschel, Dr. Maskelyne, Mr. Bishop, Mr. Hind, Mr. Lassell, Mr. Airy of Greenwich Observatory, and Mr. Adams of Cambridge, have largely added to a science which so much depends upon close patient observation, and an accumulation of facts alone—whose infinity of objects thousands or even millions of years spent in watching and registering would be insufficient to comprise. Much, however, has been done during the present period, in the enlargement of star maps and star catalogues, so that the cosmical relations of the whole heaven have been defined, and the earth's place in it as a mere point in the universe ascertained and fixed. Nor has the practical been lost sight of in the contemplation of these remote and inaccessible objects, and the discoveries of astronomy have been turned to the essentially British purposes of navigation, by calculating and fixing more accurately the position of a ship at sea. The steps by which this important object was attained, have been carefully noted in that national work, the *Nautical Almanac*, which was commenced in 1767, in connection with the parliamentary commission for the “discovery of the longitude at sea.” As astronomy was of such vital importance to the commercial interests and political welfare of our country, the study of the science was promoted by the establishment of the “Royal Astronomical Society of London,” having for its office-bearers the chief astronomers of Britain, and for its associates the principal astronomers of Europe. Another society, by which the preceding has been greatly benefited, named the “British Association for the Advancement of Science,” was opened in 1831. Our chief observatories are those of Greenwich, Cambridge, Oxford, Edinburgh, and the Cape of Good Hope; and from the principal one (that of Greenwich) there are telegraphic wires connected with the wires of the principal railways, by which its communications, and especially its time-signals, are conveyed over the island. But

notwithstanding these public institutions for the advancement of the science, some of the most important astronomical discoveries of the present period have been made by amateurs, at their own private expense or by the aid of their friends. Such has been especially the case with Mr. Lassell, a merchant of Liverpool, who built an observatory for his own use, and discovered an eighth satellite to Saturn, one to Neptune, and two to Uranus—Mr. Hind, who discovered many new asteroids—and Mr. Adams, who in 1846 discovered the new planet Neptune. The accession of this last-named planet to our system was the result of abstract mathematical reasoning so profound, and analysis so subtle and searching, as to show that future discovery is not left wholly dependent on observation and telescopic aid. But one of the most striking indications of the love of astronomical science for its own sake, was the construction of Lord Rosse's gigantic telescope. The luminous masses called nebulae, so thickly sown over the whole heaven, had perplexed scientific inquiry; and although Sir William Herschel mapped 2500 of these mysterious star-clouds, and his son Sir John added 500 clusters to the celestial chart, the nature of these luminous strata, which were concluded to be neither fixed stars nor planets, still continued unknown. To add also to this perplexity, some of these nebulae, which at first appeared only shining spots, presented, when viewed through powerful telescopes, the appearance of distinct stars, while others, though subjected to the same scrutiny, were still as incomprehensible as before. It was chiefly to explore these dim, remote, tantalizing masses that Lord Rosse constructed his wondrous telescope, with the labour and anxiety of years. The tube has a focal length of fifty-three feet, and a clear aperture of six feet; of its two specula or mirrors, one weighs $3\frac{1}{2}$ tons, and the other a little more than 4; and the instrument itself is placed between two immense piers, 70 feet long and nearly 50 feet high. But whilst the immense range of this cyclopean telescope led to remarkable discoveries among the hitherto unexplored regions of nebulae and star-dust, it also revealed dimly beyond them new regions of mystery, that demand yet larger and more improved powers of vision. But the ardour of science has only been stimulated by these past successes, and fresh endeavours are certain to follow, by which new fields of the boundless universe will be opened, and the harmonious laws of their administration be more amply and correctly understood.

Amongst the youngest of the physical sciences is Geology, which may be said to have originated in the early part of the present century. Its object is to investigate the ancient natural history of the earth. The inquiries of the science

divide themselves into two branches—viz., physical geology, or the examination of the mineral structure, formation, and succession of the rocks constituting the crust of the earth, and the laws which have regulated their origin and distribution; and palæontology, or the study of the fossil or petrified remains of extinct animals and plants embedded in the ancient sedimentary rocks. Geology thus derives its materials as a science from the three kingdoms of nature, mineralogy, zoology, and botany being its principal tributaries. On account of the recentness of its origin, as well as the extent and importance of its range, a more than usually ample detail of the history of a science which is only coeval with ourselves will naturally be expected.

From an early period the more obvious phenomena of geology attracted the attention of the cultivators of natural science in the enlightened nations of the eastern and the western world; but it was not till the other physical sciences were established upon a solid basis that it began to assume a philosophical form. Previous speculations on the subject usually resolved themselves into cosmogonies, or attempts to account for the origin of the globe, an inquiry manifestly beyond the range of scientific investigation. Towards the close of the last century, the celebrated Dr. Hutton of Edinburgh published his theory of the earth, a work in which a clear conception of the legitimate objects of the science was first announced in this country. Throwing aside the bewildering dreams of the cosmogonists, Hutton set out by declaring that geology was in no way concerned with questions as to the origin of things; and although his work is avowedly theoretical, his theory was founded upon a large induction of facts, and anticipated some of the most important principles which have been generalized from the multiplied observations of the last fifty years. Geology thus born, could only, like other sciences, be developed by opposition; and this, fortunately, was not long wanting. A lively controversy was waged for a considerable period between the followers of Hutton and those of Werner, a German professor of mineralogy, on the merits of their respective theories—the latter school ascribing the formation of the ancient rocks of every description to chemical precipitates from a chaotic fluid, the followers of Werner being therefore named Neptunists; while the disciples of Hutton called in the agency of subterranean fires to account for the production of the crystalline or unstratified rocks, and the elevation of submarine strata, and were hence called Vulcanists. Werner, however, had the merit of first determining the order of the succession of rocks, in so far as their superposition could be ascertained within a limited

area, by their mineral characters. In the meantime, William Smith, a mineral surveyor, succeeded by a series of independent researches, pursued under circumstances of extraordinary difficulty, in establishing the succession and relative antiquity of the secondary rocks in England by their organic contents. A new and efficacious instrument of investigation was thus placed for the first time in the hands of the geologist, enabling him to connect the vital with the physical phenomena of a science of the earth, and geology, now brought within the pale of inductive reasoning, ceased to be speculative and visionary. A neutral school took its rise in London in 1807, in the establishment of the Geological Society, the members of which formally agreed to abstain from theories, to devote themselves to the accumulation of facts and observations, and patiently to await the results at some future period. In the year following, France contributed its share to the infant science, by giving to the world the great work of Cuvier and Brogniart, on the organic remains found in the neighbourhood of Paris. Geology is therefore indebted to three different nations for its advancement, in the early part of the century, in three of its great branches of inquiry—to Germany, for accurate views of mineralogical geology; to England, for the classification of stratified rocks by their fossils; and to France, for the first light thrown upon the deposits of the tertiary period. The science has ever since been sedulously cultivated in Europe and America, and has grown with unexampled rapidity, every year adding to the breadth and stability of its foundations, and the depth and significance of its results. The observations promulgated by the founders of the science have been confirmed and extended over a large portion of the globe. The same kinds of rocks are found to recur in groups, with unfailling regularity, from the equator to the pole. By the study of the ancient forms of life, the geologist has been able to classify the stratified rocks into great life-periods, each characterized by forms of animals and plants peculiar to itself, yet all exhibiting recognizable features of a plan of structure, which, although subject to a boundless diversity of adaptations, shows that the laws of organization and of life were the same in the remotest epochs that they are now, and that the same infinite wisdom and goodness have been manifested in the creation and preservation of living beings in all ages. While geology confirms the testimony of revealed truth as to the comparatively recent period at which man appeared on the earth, it also affords unequivocal evidence of the previous existence of tribes of animals and plants, which were successively removed from the surface of

the globe, at intervals of inconceivable duration, and replaced by new races, suited to new physical conditions, and called into being by successive acts of creative power.

Apart from its philosophical interest as a science, geology possesses an economic value which is attracting the attention of the governments of Europe and America, and leading to the adoption of measures for rendering geological observation subservient to the development of mineral resources. The ordnance survey of the British Isles, which has been for many years in progress, now embraces the geological survey of the country, and the results are laid down in the ordnance maps. A museum of economic geology has been established in London along with a school of mines, to which is added a mining record office, where an account is kept of all subterranean operations, and the value of their products. Similar surveys have been in progress for many years in more than half of the United States. In private enterprise, much money is now saved to landed proprietors, which was formerly wasted upon efforts to discover coal in rocks, where the geologist would at once pronounce such a discovery to be impossible. Agriculture is also reaping solid benefits from the practical application of mineralogical geology to the improvement of the soil. The principles of the science have in like manner been made available in the construction of artesian wells. While in these and other ways geological science is ministering to our material prosperity, comfort, and health, the discoveries of the science are subjects of growing interest amongst all classes of the people. As a subject of study, geology ranks next to astronomy in the stupendous nature of the problems it presents to human inquiry. Its noblest triumphs are to be found in its contributions to natural theology, and the light which it reflects on the being and attributes of God. In no country has the science been cultivated with more zeal and success than in Great Britain; and the names of Lyell, Buckland, Murchison, Sedgwick, Phillips, Hopkins, Hugh Miller, and a host of others, will always be proudly associated with the period of our history, that witnessed the rise of the stately fabric of the modern geology.

In the period now under consideration (1830–1860), or rather from the commencement of the general peace which followed the downfall of Napoleon to the present day, enterprise, having for its object Geographical and Scientific research, acquired an unusual degree of vigour and persistence. Discovery, it might be supposed, must grow rare as the world grows old, and little remains to be discovered; but the fact is, that the world, considered as an object of inquiry, never

grows old: intellectual progress extending the range of vision, or changing the point of view, continually finds novelty in fields apparently exhausted.

When Great Britain in 1815 disbanded her army and reduced her navy, the pressure of the now unoccupied aspirants after fame and adventure was felt chiefly at the admiralty, and by the African Association. At the admiralty a secretary, fervently admiring the achievements of Hudson, Baffin, and Frobisher, and disposed to revive the long-exploded project of a north-west passage to India, aided with his influence the professional ardour which sought employment at any risk. The consequence was that four ships were fitted out in 1818, two to proceed to the North Pole, and two to Baffin's Bay, the latter expedition under the command of Captain John Ross, to endeavour to make their way to the Pacific. This was the first of a series of expeditions to the Polar regions, so remarkable in themselves, and through the force of circumstances so perseveringly, though unwillingly continued, as to deserve being recounted somewhat in detail.

Both these expeditions totally failed to discover the proposed passage, but as the existence of the range of mountains, said by Captain Ross to stretch across Lancaster Sound, and close it on the west, was denied by his officers, the disappointment in that quarter tended rather to inflame than to damp curiosity; and in the following year (1819), two ships were sent out under Parry, who had accompanied Ross, to repeat the attempt to penetrate through Lancaster Sound. At the same time Franklin, who with Buchan had sought in vain for an open sea about the North Pole, was sent overland from Hudson's Bay to explore the coasts eastward of the Coppermine River. Parry's expedition was remarkably successful. Though he did not make the passage to the Pacific, he crossed the meridian of 110° W., and obtained the £5000 voted by parliament for that feat. Franklin's party endured dreadful sufferings, which were ill compensated by the exploration of a few hundred miles of coast.

Encouraged by the popularity attending Parry's bold advance westwards, the government no longer hesitated to fit out expeditions for the Arctic regions. In 1821-23, the same officer examined Repulse Bay and the neighbouring shores. In 1823, a vessel, despatched to enable Captain Sabine to make experiments with the pendulum as near as possible to the pole, reached lat. $80^{\circ} 20' N$. In 1824 Captain Lyon sailed to examine Wager Inlet. In 1824-25, Parry commanded a third expedition, which had less success even than his second. At the same time

Franklin repeated, with better issue, his attempt to survey the northern coasts of the American continent, and was most effectually aided by Dr. Richardson. The boats of a vessel sent to the Polar Sea by Behring's Straits to co-operate with Franklin, traced in 1826-27 the coast of the continent eastward till within 150 miles of the most western point reached by that traveller. In 1827, Captain Parry started on his fourth voyage, his design being to travel over the ice from Spitzbergen to the pole, but he found it impossible to get beyond $82^{\circ} 45'$, as the ice drifted southwards, while he travelled over it in the opposite direction.

So many disappointments after a flush of success produced a revulsion of feeling, and the government now resolved not to equip any more Arctic expeditions. But Captain J. Ross, aided by private munificence, started in 1829, discovered the peninsula which he named Boothia Felix, and having spent three successive winters in the ice, returned in 1833. His long absence awakened public interest. Captain Back, sent to seek intelligence of him, descended the Great Fish River (1833-35), and in 1836 examined to little purpose the inlets on the northern side of Hudson's Bay. The Hudson's Bay Company also despatched an expedition in 1836-39, which fulfilled its purpose of completing the survey of the northern shores of the continent, from Behring's Straits to Boothia Felix, and the subsequent expedition of Dr. Rae from the same quarter carried this survey still further to the north.

The comparative success and small cost of the land expeditions, led by experienced fur-traders, proved the folly of sending out ships to winter in the ice, and it was generally understood that Arctic voyages were at an end, when it was announced, in 1845, that Sir J. Franklin was about to repeat the attempt to find the north-west passage. This expedition was probably conceded as a boon to the aged secretary of the admiralty on his bidding farewell to office. Three years elapsed and nothing was heard of this expedition; government then, aroused by the general alarm, sent forth three expeditions in search of the missing one, viz., one to Behring's Straits, that of Sir J. Richardson overland, and Sir James Ross to the Boothia peninsula. These were followed by the expeditions of Collinson and Maclure, of Austin and Ommaney, of Belcher and Kêllett, and finally of M'Clintock, besides several others not fitted out by the government. Maclure alone passed through from Behring's Straits to Baffin's Bay, and may thus be said to have discovered the north-west passage, and M'Clintock ascertained the fate of the missing ships: Sir J. Franklin died a natural death in the strait which bears his name, and his com-

panions, wintering in King William's Land, which was explored by James Ross in 1834, were destroyed by cold, hunger, and disease.

Thus in the course of forty years at least fifty ships were sent out with picked crews, and provisioned for two or three years, to solve a problem of no practical value. Their narratives, however, all bear witness to the energy and good discipline of the British navy. The expedition of Sir James Ross to the Antarctic regions in 1844, had for its object scientific observations, which determined approximately the position of the south magnetic pole.

The activity of the African Association was for obvious reasons less enduring. In 1818 the region south of Tripoli, extending to Murzuk and Ghât, was explored by Ritchie and Lyon, and the latter published a narrative containing much valuable information. It still remained, however, to cross the desert to Negroland. This was undertaken, in 1823, by Denham and Clapperton, who were well received by the ruler of Bornu, the first of these travellers penetrating southwards, while the other proceeded westwards to Haussa and Sokatu, the Fellatah capital. The latter point presenting peculiar attractions, Clapperton had no sooner returned, by way of Tripoli, from his first expedition, than he started on a second, to reach Sokatu from the coast of Guinea, and to trace the great river of that country, the Quorra, to the sea. The latter and more important part of the zealous traveller's plans was frustrated by his death, but his servant, Richard Lander, in returning to the coast, traced the river, which at the present day is popularly, but with very little reason, called the Niger (the Joliba of Park, who descended it to Boussa), to the Bight of Benin. Several attempts were made by Laing, Gray, Dochart, and others, to penetrate to the interior through the country of the Mandingoes, and the first-named of these travellers was murdered on his way from Twat to Timbuktu; but as none of these attempts had such results as would entitle them to more than a passing notice in a brief sketch, we hasten on to enterprises of more recent date, and of greater importance.

In 1847 Mr. Richardson, connected with the press in Malta, succeeded, by an excursion to Ghât, south-west of Tripoli, and by papers on the trade of that region, in attracting the notice of the foreign office, and his offer to lead an expedition to Bornu was accepted. Two Germans, Drs. Barth and Overweg, were charged with the scientific branches of the mission. After much waste of time and loss of property, the expedition arrived on the borders of Negroland, and there separated, its members pursuing each his own course. Richardson died soon after. Over-

weg lived to visit Tacoba, and to sail on Lake Tsad, but left at his decease no legible journal of his proceedings. All the objects of the expedition devolved therefore on Dr. Barth, in whom resolution and physical strength were fortunately united to a spirit of inquiry. He penetrated southwards to Adamawa, in lat. $8\frac{1}{2}^{\circ}$ N., the most southern possession of the conquering Fellatah, crossing in his way the great river Benue, at its junction with the Faro. The Benue is the upper course of the large river which joins the Quorra in lat. $7^{\circ} 50'$, and which, through some mistake of its first discoverers, received the name of the Chadda. The discovery of a navigable stream flowing through the most fertile countries of Negroland, and easily accessible, was of vast importance, and measures have been taken to turn it to account.

Dr. Barth made an excursion to Baghirme, crossing two navigable streams, which fall united into Lake Tsad. He also spent a considerable time in Haussa, and in the Fellatah kingdom of Sokatu. He then travelled south-westwards to the Quorra, and crossing it took the southern road to Timbuktu, where he spent some months, and then returned along the northern bank of the river to Haussa and Bornu. The most curious of his multifarious chapters are, perhaps, those which describe the tribes of the desert and the mixed races of Asben.

For many years a trade of unknown extent has been carried on between the colony of the Cape of Good Hope and the native tribes scattered over the adjacent interior. The Cape traders are often absent for two years, and return from distances of which they take little account, with their waggons laden with skins and ivory. It is said that in 1837 a Boer drove his waggon to the Zambeze. All these travellers heard of the great lake in the interior; and when English sportsmen, incited by the example of Captain Harris, began to frequent the country of the Bechuana in pursuit of large game, it was easy to foresee the direction in which exploration would advance.

In 1849 the sportsmen Oswell and Murray, accompanied by the missionary Livingston, first reached the banks of the Lake Ngami. But then, as well as in the following year, they were defeated in the attempt to reach the country of great rivers, said to lie further north. In May, 1853, however, having vanquished all difficulties, they stood on the banks of the great river, which they then called the Sesheke, and conjectured to be identical with the Zambeze of the eastern coast. Animated by this conclusion, Livingston ascended the river (now called the Lœambye), towards the N.N.W., crossed the Casabi and Quango into Angola, and at Loanda, the capital

of the Portuguese colony, announced that he had discovered the Zambeze flowing through the middle of the continent. On his return to the interior down the Leeambye, in 1855, he descended this river to the falls, where it is dammed up by a rocky ledge, then went north-west over the highlands, till he came on the Zambeze, which he descended to the sea, and pronounced it to be navigable for large vessels to the interior. Having returned, however, to the Zambeze, in 1858, to complete his discoveries, he has ascertained that river to be navigable only in boats of light draught, and not much further than Tete. The connection of the Zambeze with the Leeambye remains still unproved.

The existence of a lake of great extent, from north to south, called Nyassi, on the eastern side of Africa, was proved in 1845 by Mr. Cooley, who produced, in 1852, a map showing the route to Ujiji, on the shores of the lake. The particulars collected by the missionaries near Mombas gave this inland sea an enormous extent. Thus magnified, and situate too, as it was supposed, in the famed region of Monomuzi, it is no wonder that it should attract travellers of the more enterprising and enduring class. In 1857, Captains Burton and Speke commenced their journey into the interior from the coast near Zanzibar, and after nearly eight months of severe toil, reached Ujiji, and navigated the lake, called by them Tanganyika. Captain Speke also visited another lake (Nyanza) lying to the north-east of the former, to which hearsay information attached much importance. It is to be feared that these travellers, unacquainted with the language of the natives, have too often made use of their experience only to decorate their own preconceived opinions. The country and great empire of Uniamoezi, described by them, is certainly unreal; and we hesitate in following them to the supposed southern limits of Lake Tanganyika, and the countries to the south-west. But they have unintentionally proved that there are no difficulties or dangers to be encountered in this part of Africa which a prudent traveller may not easily overcome.

Respecting Australia, we might briefly say that the discovery of its interior has been effected entirely during the last thirty years. If our acquaintance with that interior be still incomplete, yet it has advanced with astonishing rapidity. The mountains first explored by Hume, thirty years ago, are now thickly peopled with miners. The rivers Murray, Darling, and Murrumbidgee, now navigated, were discovered and traced downwards by Major Mitchell in 1836. In the glens of the granitic mountains, about the sources of these rivers, lie the auriferous deposits which have rendered Australia the richest gold-

producing country in the world, California alone being excepted. Eyre explored the whole southern plain from east to west. Sturt examined the desert interior north of Spencer's Gulf. Mitchell, and subsequently Leichhardt, explored vast tracts of comparatively good country on the eastern side. The western side was penetrated by the expedition of Grey and Lushington. Rae and others have surveyed the interior near Swan River; while Gregory has thoroughly examined the vicinity of the Gulf of Carpentaria and the northern shores.

The New World, it might be thought, is by this time fully known, and offers no longer any room for geographical discovery. Even the most inhospitable wilds of North America are constantly visited by the indefatigable hunter and fur-trader. But civilization, the main-spring of which is intercourse, requires exact knowledge, and therefore we feel justified in classing among new and important discoveries the survey recently made by Captain Palliser, between the Red River (flowing into Lake Winnipeg) and the shores of British Columbia, which has resulted in the discovery of more than one pass through the Rocky Mountains, in which the construction of a railway would be practicable. The line thus carefully surveyed cannot fall much short of 1500 miles in extent. As the auriferous veins or detritus which have stimulated so wonderfully the growth of California, and have raised St. Francisco in a little time to the rank of a rich and populous city, seem to extend also into British Columbia, and to hold out promises of rapid growth, the practicability of a railway communication with it across the continent is highly interesting and important.

To the same class of scientific labours, which completes the work of discovery, belongs the trigonometrical survey of the British Islands, which, growing continually more perfect in its execution, is now approaching completion. The triangulation of India, too, is complete, and embraces an arc of the meridian of sixteen degrees. It will materially aid in the construction of railways, which are destined to infuse new life into the industry of India.

Another branch of scientific labour, more closely allied to discovery, is that of the hydrographical surveyor, who is in general little taken notice of, though he works hard for the obvious benefit of mankind. It is a surprising fact, that within the last forty years probably not less than two-thirds of the accessible coasts of our terraqueous globe have been surveyed by officers of the British navy. We can speak with certainty as to the coasts of the British Islands, Newfoundland, the Mediterranean Sea, the Persian Gulf and Red Sea, the shores of Arabia

and Africa, Australia and New Zealand, America (excepting the United States), the West Indian Islands, and several groups in the Pacific. The survey of the Chinese and Japanese Seas is now (1860) in progress. When the nature of this work is considered, the perseverance and skill required for its execution, and its permanent effect on general commerce and the welfare of the whole human race, it seems entitled to our highest admiration.

Hitherto we have contemplated the improvement of the sciences in their application to the arts of peace, and to the benefit of humanity at large. But we cannot yet flatter ourselves with the thought that the good has been wholly unalloyed; and while in some cases this improvement has merely ministered to the selfishness of our nature, in one striking instance it has been made the agent of man's vindictiveness and love of destruction. We allude, of course, to the changes of modern Warfare, by which it has been rendered more deadly and ruinous than ever, and the beginning of which we had occasion slightly to notice in our account of the campaigns of the Crimea and India. By the introduction of the Minié and Enfield rifle, a fearful certainty is given to the aim of the distant marksman; while against the destructive and far-reaching cannonade of the Armstrong and Whitworth artillery, it seems as if no human architecture could stand. We shudder as we read of the rifled cannon-ball winging its flight for miles, striking the object aimed at as if it had been but a few yards off, and crushing men and ramparts until its course is exhausted. While science has thus increased the range, and given certainty to the deadliness of the soldier's missiles, the electric telegraph has been brought into full play for the movements of the campaign and the operations of the battle-field, so that the plan at headquarters can be instantly communicated over the whole range of action. War as a science has been changed, but only by becoming tenfold more ruinous; and while the means of offence have been thus improving, the means of defence have been undergoing a correspondent alteration. On land, the ramparts of stone that were lately thought to be impregnable, are to be superseded by stronger and more scientific masonry, or exchanged for artificial mounds of earth, which artillery cannot shake; and steam-ships are already launched and ready for action, so completely covered with an armour of malleable iron, that the cannon-ball at certain angles rebounds from them without inflicting serious damage. And whither is this warlike revolution to conduct us? How is it to terminate? "In universal peace," is the hopeful reply. Men will no longer go forth to war when the certainty of being slain be-

comes absolute, and when little chance of personal distinction is left to them amidst the wholesale and indiscriminate carnage. In the meantime, one great advantage is secured by the change before the arrival of the millennial day. It is, that mere brute force and courage can no longer be the only available arm of warfare, or a civilized nation be overrun by one that is barbarous. Science is now the great military arbiter of the destiny of nations, and their civilization has become their best and surest protection. The glory and the triumphs of such conquerors as Attila, Tamerlane, and Genghiz Khan have for ever passed away.

We have thus simply indicated rather than described the intellectual tendencies of the present day. Feeling as if enough had already been achieved in general literature, and in the sciences of ethics and metaphysics, the mind has sought new worlds to conquer, and in the plenitude of its might and activity has laid hold of the physical sciences, in the assured confidence of a similar success. And this too, chiefly with a reference, not to the satisfaction of intellectual curiosity or restless mental activity, but practical and substantial results. The spirit of the age is eminently utilitarian, and not a particle of matter escapes its research with the view of turning it to a useful account. To abbreviate time and space by the wondrous agency of steam and electricity, to increase the measure and multiply the means of subsistence and comfort, to improve health and lengthen life—even to extinguish war by so enlarging its destructive agencies, as to make war itself a hateful and a losing game to all parties—these have been the chief attempts of the last thirty years, under which the world has been revolutionized, and a new career commenced, the end of which it is overwhelming to anticipate.

With such a tendency, and amidst such successes, it is not to be wondered at if the previous zeal for the cultivation of Literature should have suffered some abatement. While it was felt, indeed, on the one hand, that little more in this department was left to be done, it was found on the other, that new fields had been opened in the material world as interesting as those of the mental, and also more tangible and substantial, where the most refined intellect could find its proper objects of study, and ambition or philanthropy erect the best trophies of its success. A great and useful discovery in physics, by which the human race at large is to be benefited, is not imprisoned within a single language, or only appreciated by the highest in taste and intellect. If therefore we have fewer metaphysicians, critics, poets, moralists, historians, in the present than the preceding period, we can console our-

selves with the thought that it is because our master-intellects have found other fields of occupation, of which we are daily reaping the fruits. A new movement of the human mind has commenced, of which the present is the transition period between it and the old: and that period is chiefly occupied with those literary celebrities who either were the lights of the former generation, or whose aptitudes are more for literary than scientific research. We had till lately, and in unabated vigour, the octogenarian De Quincey, whose eloquent writings in every literary department extended over half a century; and Leigh Hunt, who, as political writer, journalist, poet, and essayist, delighted two generations and the boyhood of a third; and Lord Macaulay, who, after a brilliant career as statesman, orator, biographer, essayist, and reviewer, achieved for himself his last and highest distinction as an historian of England. But the most eminent of them all, as well as their concentration, is the venerable Lord Brougham, that living connecting link between the old intellectual world and the new, who after winning the highest distinction in the literature of the one, has advanced into the science of the other with an ardour and activity still unabated and unchecked. Then we have Thomas Carlyle, the merciless iconoclast of idol theories and modern philosophical paganism; and the Duke of Argyll, the able expounder and advocate of physical science; and Mr. Gladstone, the eloquent denouncer of that Neapolitan tyranny which has formed so strong a barrier against Italian regeneration. Many other names might be given to prove that the spirit of literature has not yet died among us, and that its lustre is only overcast for the time by the inauguration of a new era, and the more popular character of its pursuits. Of these, we shall only mention the names of Froude, Grote, Napier, Dr. Arnold, and Alison, in history, and Lord Campbell in biography, as sufficient to be suggestive of others. In biography, indeed, there will never be a lack of authorship, as long as eminent men exist, or friends and relatives to embalm their memory; and hence the monthly issues from the press of "Lives" and "Memoirs" in unabated profusion, and with all their former variety of excellencies and defects. The same plentiful supplies continue in the departments of classical, theological, and antiquarian learning, and also in light or miscellaneous periodical writing; for these are departments which will continue to be loved and prosecuted for their own sake to the end: but even in these we miss such high names as aggrandized them some thirty years ago, or at least, we feel no such interest in finding them out, and holding them up as the lights and guides of the day. In reading over the lists of living authors, there is

one peculiarity that cannot fail to strike even the most unobservant. It is the great number of female names as compared with any former period. Nor are these confined as before to the merely imaginative departments, to novel writing and poetry, but are extended over those from which they had been formerly excluded; so that in biography, history, and the fine arts, in antiquarianism, even in theology, ladies are distinguishing themselves by their writings, and commanding the homage of that sex into whose exclusive province they have so worthily entered. Well is it that woman is thus showing herself a "help meet for man," let man become as learned and intellectual as he may! A new era for the sex is dawning, and woman's full rights as well as her true mission are beginning to be better understood.

Although science has now obtained the predominance over literature, one literary department is still left not only undiminished, but of greater influence than ever. Man is not only an imaginative being, but his imagination, as it is the earliest, is also the strongest of all his intellectual faculties, and let whatever study predominate for the time, its cravings must be satisfied. As this faculty also is so generally inherent, even where the others may be scanty or inert, every one must have an ideal world of his own, to which he can retire from the daily toil and dull realities of the present; and whether it may be the minstrel's ballad or the impersonations of the actor, the romance, the allegory, or the tale, it is the resting-place upon which he falls back, according to his own particular tastes and capacities. But in the advance of society to its present point, many of these resources have necessarily dropped off at each stage of progress, while invention was unable to discover something new to substitute in its stead. Thus the troubadour passed away; thus the romance was flung aside as a dull absurdity; thus, too, even the drama has ceased to charm, and its "beggary account of empty boxes" been converted into firewood. And what then remains? The novel, and nothing but the novel. It alone has survived, because its fictions were founded upon reality, and not upon giants, knights, and enchanters, incredible loves and battles, and impossible reverses; and it continues to increase as a literary power by how much it combines high feelings and startling incidents with the character of reality and truthfulness. These circumstances will account for the present prevalence of novel writing beyond any former precedent, and for the high standard that has been imposed upon it. Almost every man and woman—nay, almost every child, is more or less a novel reader, and must have novels worth reading. The demand of course

has created a correspondent supply, and the ablest intellects of the day write novels. Hackneyed plots and dull frivolities will no longer be tolerated, and therefore the novel, while an attractive tale and a true picture of life, must also instruct, purify, and elevate. In consequence of this demand, almost every theory of history, politics, morals, theology, science, is to be found incorporated in the novels of the present day, and illustrated with an eloquence, clearness, and impressiveness to which learned formal essays cannot always attain.

As the novelists of the present period are so numerous, a list of even the principal writers in this department would exceed our limits. But this becomes the less necessary, as they are so generally known and appreciated. Foremost, perhaps, in the list may be mentioned the name of Charles Dickens, who, under the homely name of Boz, took the public by storm in his well-known publication of the *Pickwick Papers*, and has maintained his popularity unabated to the present hour. Of scarcely inferior note is W. M. Thackeray, whose vigorous sketches of life and character are heightened with the reflectiveness of Fielding, and almost the causticity of Swift, and who, with greater toleration for the weaknesses of humanity, and a higher enthusiasm for its merits, might perhaps be more popular still. Then, we have Sir Edward Lytton Bulwer, the statesman as well as novelist, who at an early period of life commenced a brilliant career by his first popular work, *Pelham*; who continued for a time to be the delineator and eulogist of fashionable coxcombs and essenced *roués*; but who afterwards forsook these heroes of his youth, for characters of a higher stamp, and subjects of a more ennobling character. One of our most distinguished novelists, also, is Benjamin D'Israeli, whose name has already so often occurred in our pages but under a different capacity—who, like Bulwer, was a writer of novels before he became a statesman, and whose favourite themes have been the grandeur of the Jewish race, and the high destinies that yet await them. All these writers achieved a high reputation while still young, and have continued to maintain their pre-eminence against a whole world of competition, so that the annunciation of a new work from any of them is enough to set the whole novel-reading world on tiptoe. Of the names inferior to these of the first rank, we can only mention Kingsley, Warren, Collins, Reed, James, Carleton, Lever, Lover, Grant, Ainsworth, Anthony Trollope—the popularity of whose works is attested at every railway station, and which are almost as common in the hand of every traveller as the railway ticket. But further we will not attempt to enumerate, as

the list would otherwise “stretch out till the crack of doom.” In an age of such female intellectual activity, and in a department where ladies are so fitted to excel, by their quickness of observation, tact, and delicacy, they fully divide the popular estimation with the other sex, and assert their equality in talent, however different in kind. Of these female novelists, the first place is due to Charlotte Brontë, whose writings exhibit a wonderful combination of masculine vigour with feminine delicacy; Miss Mulock, who is equally at home in the ages of romance and the scenes of modern everyday action; Mrs. Gore, the prolific delineator of all the lights and shadows of fashionable life; Mrs. Marsh, whose well-known series commenced with *Amelia Wyndham*; Miss Evans, the author of *Adam Bede*; and though last, not of secondary account, Mrs. Trollope, who delighted the previous as well as the present generation by the *vis comica* of her caricature sketches. But here, also, we must abruptly close the list against the crowd of coming names all more or less worthy of notice. Our scantiness of enumeration, however, both of male and female novelists is the less to be blamed, when we remember how rapidly such names rise into notice, and how quickly they disappear and are forgot. This species of writing, as it is the most common and prolific of all literary reputations, is also the most evanescent. The novel is read and the amusement is gone. The author's aim was perhaps nothing more than to amuse, and he has had his reward. The tale of yesterday can no longer call us back when the tale of to-day is at hand.

In the foregoing period of our history, the chief amount of literary effort was bestowed upon periodical literature, in which department the highest place was occupied by the monthly magazines and quarterly reviews. These were the arbitrary dictators and influential guides of the past generation, not only in literary but political opinions, while the *prestige* they had won was well supported by the high names and superior talent which these publications were able to command. But much of this influence has passed away, partly through the elevation of the general intellect which they mainly contributed to effect, and partly by the diversion of the public tendency into different channels. The intellectual impatience of the age, also, which has been so largely increased by telegraphic communication and railway travelling, will no longer contentedly wait for three long months, or even a single month, to learn the oracular verdict of the magazine upon events which are passing at railway speed. Still, however, the power of habit remains, although the interest in these publications has abated, and readers cannot

lightly abandon the periodical from which their literary bias was derived, and their views of men and books established; and therefore these works continue to issue from the press, although with a diminished circulation. Of the quarterly journals, there are at present 35, and of the monthly magazines about 300, published throughout the United Kingdom.

But the great literary power which now predominates beyond all others, not only in Britain, but over the whole civilized world, is the *NEWSPAPER*. This, which has been called the Fourth Estate in our own country, and which has frequently a voice more potential in the government of the kingdom than that of king, lords, and commons united, may also justly be termed the *maire de palais* of despotic monarchies, and the tribune of republics. It is not to be wondered at, also, that this ominous broadsheet should be so all-prevalent in its influence, when we remember its origin and its uses. In its rudest state it is the voice of a government announcing its will to the public, and instructing the subject in his duties. Going higher still, it becomes the expression of the popular voice to the rulers, proclaiming the public wants and wishes, and upon what terms the people are willing to submit to rule. In this way it is the barometer of the political horizon, in which statesmen can read the propriety of their measures, or be warned of disaster and change. It is nothing more than natural, therefore, that in an age of general intelligence, and with such abundant means of printing and transmission, there should be newspapers in almost every language; and that these should chiefly consist of a daily or weekly history of the government, and popular comments upon its proceedings. It is equally natural that such means of general intelligence should be regarded by rulers with a suspicious eye, and this especially when the rule is unpopular, or when some aggression upon the liberties of the people is attempted. When such an attack is to be made upon the popular rights, the first step of the usurpation is to arrest the journals, while on the other side the "liberty of the press!" is the first war-cry of resistance. Such being the nature and importance of the newspaper, it could not be otherwise than that Britain should become its indigenous soil—that there it should take root and flourish—and that having attained such pre-eminence, it should comprise among its contributors so large a proportion of the intellect of the day. But it is not merely as a great source of political intelligence, and exponent of national or party feeling, that the newspaper is valued among us. As a commercial country the interests of Great Britain are identified more or less with every land, and

without prompt regular tidings from all their markets, our national resources and mercantile enterprise would be alike suspended. And even to those who are indifferent to politics or commerce, the newspaper is so essential, that like other regularly used luxuries, it has become a necessary of life. It comprises not only the news of the whole world and the whole empire, but also of the particular town or district which each reader inhabits; and its columns satisfy the curiosity with which he awakes in the morning, and furnish him with topics of conversation for the day. On these accounts, the absence of his broadsheet would be almost equal to the loss of his breakfast. While among the literary and intellectual no kind of reading is taken up with greater zest or punctuality, there are tens of thousands who may be said to read nothing else, and whose intelligence, such as it is, has been derived chiefly from the newspaper.

As a free constitution and the liberty of the press are so essential to the existence of this department of journalism, Britain and the United States of America are naturally the countries in which newspapers are most abundant. In France they would be far more abundant than in either of those countries, in consequence of the restlessness of the national character, and the rapid important changes of the government, were it not for those numerous restrictions under which they are so often coerced by the ruling powers. The origin of the newspaper in England was generally supposed to have been in 1588, the epoch of the Spanish Armada, and that the *English Mercurie* was then published by order of Queen Elizabeth, to allay the popular alarm; but late inquiry has shown that this report is a fiction, and that the specimen of the *Mercurie* preserved in the British Museum is a literary forgery. It was not till the beginning of the seventeenth century that newspapers were issued in England, under the name of a "pamphlet of news," at first irregularly and at long intervals, until the reign of Charles I., and the civil war which ended in the establishment of the Commonwealth, brought the spirit of journalism into its natural activity. Even then, the influence of this powerful political weapon was appreciated, and the two great parties in the state had their rival newspapers, of which the spirit was as keen, and the language more violent, coarse, and abusive, than would be tolerated in the present day. But it was at the accession of Queen Anne, when talent was so abundant, and public events of such importance, that the newspaper acquired that high political ascendancy which has been going on to the present hour. It was in her reign, also, that the first tax was laid upon the newspaper. Ostensibly, it was as a fruitful source of revenue

that the government stamp was imposed upon it; but the real design was, the suppression of libellous articles and attacks upon the ruling powers. The duty imposed was a halfpenny upon papers of half a sheet and less, and a penny upon those which ranged from a half to a single sheet, and it commenced operation on the 19th of July, 1712. But this attempt to suppress the liberty only increased the license of the press; and it was soon found, that the most profitable of all martyrdoms, as well as the best chance of popular distinction, was to incur the penalty of fine or imprisonment for libelling the powers that be. It also provoked a variety of fraudulent attempts to elude the tax, which had risen from a halfpenny and a penny to fourpence. This was especially between the years 1831 and 1835, when scores of unstamped newspapers had started up, inculcating republican doctrines and revolutionary violence, and when the number of prosecutions for such offences was more than 700, in the course of which nearly 500 persons had been punished with imprisonment. In short, it was found out that this tax upon knowledge was not only useless but pernicious, and that at best, a revenue of £553,000 from 36,000,000 stamped newspapers annually, was but a poor compensation for the mischief. In 1836, therefore, the tax was reduced from fourpence to a penny, and on the 15th of June, 1855, was wholly repealed. Thus was the public press set free after the restraint had lasted 143 years, and been from the first a plentiful source of demoralization, crowded jails, and popular discontent. The effect of this repeal of the tax on newspapers was, that eighty new ones were established in 1855, and twenty-seven in 1856, of which twenty-six were metropolitan and eighty-one provincial. In 1857 the total number of newspapers published throughout the United Kingdom was 711, of which 289 were on the side of liberal politics, 173 conservative, 246 neutral, and 3 democratical.

In that department of the history of progress in English literature which we devoted to Poetry and Poets, we found the subject so abundant, especially during the last of the preceding periods, comprising the close of the reign of George III., and the whole of that of his successor, that it seemed to bear an undue proportion to the other literary departments. But this was inevitable on account of the poetical richness which forms so essential a characteristic of the English mind. What country, indeed, at least in the whole range of modern history, has produced poets in such abundance, and poetry of such excellence? Athens had her era of Pericles, and Rome the reign of Augustus, and these were sufficient to make the poetical renown of either country imperishable; but England has enjoyed not one

but four great poetical epochs, each of highest excellence in its especial characteristics. This was much, especially when we remember that poetry, instead of being a perennial flower, is like the aloe, which blossoms only once in a hundred years, and often not more than once during its whole existence. And has the bright tree of England been exhausted by four centuries of periodic exuberance? Even if it must be so, there would be little room for dissatisfaction or complaint. The eras of Chaucer and Gower, of Spenser and Shakspeare, of Milton and Dryden, of Wordsworth and Byron, have each of them a mighty influence and a deathless remembrance, so that our country can afford to hang her well-worn harp upon the wall, and give place to younger nations. That harp, indeed, is still heard, but it is only in the echoes of its latest notes, or in the murmur of the wind through its strings. Such, compared with that of thirty or forty years ago, is the poetry that still lingers among us, and a few sentences will suffice for its notice.

The first name we select among the poets of the present period is that of Lord Macaulay, with whom poetry was but a recreation from more absorbing studies by which his fame will be more lastingly perpetuated. His poetical productions, which are few, under the titles of "Lays of Rome," and "Lays of the Huguenots," are characterized by that rich imagination, delicate taste, and mastery of language which distinguish his prose productions, and show that his lordship might have become eminent in poetry, if it had formed his chief pursuit, instead of an occasional amusement. Sir Edward Lytton Bulwer, besides being one of our most distinguished novelists, has also won what may prove a more permanent reputation as a poet, so that his satires on fashionable life, his plays of the "Lady of Lyons," "Duchess de la Valliere," "Richelieu," and his romance-epic of "King Arthur," will probably be perused after his novels have been superseded by others of fresher date. We had also a popular dramatic author in Thomas Noon Talford, whose three productions, the "Athenian Captive," "Ion," and the "Massacre of Glencoe," the first two being constructed on the classical model, were among the last flashes of the national dramatic spirit, and seemed only given forth to grace its final extinction. Superior perhaps in real poetical power to any of these, and who might have won a still higher place but for the nature of his subject, is Bailey, the author of "Festus." This large production, imbued with the metaphysical spirit of Goethe's "Faust" and Wordsworth's "Excursion," is a daring inroad upon the present established order of things, and prophetic anticipations of a social;

political, and moral millennium for the world; but although the ambitious character of the subject, and the vivid original poetry by which it was illustrated, made it to be hailed by a few chosen admirers as the dawn of a new poetic era, "Festus" has failed to justify these expectations, and is now almost unread. Of these poets of the day, however, it scarcely can be said that any of them would have won even a second place in that bright constellation which had previously faded away into the daylight of its renown. After these, may be mentioned without particular note, Coventry Patmore, author of the "Angel in the House;" James Ayton, professor of rhetoric in the university of Edinburgh, author of "Lays of the Cavaliers;" W. R. Jamieson, author of "Nimrod," a dramatic poem; Robert Browning, author of "Bells and Pomegranates," and "Paracelsus;" and R. H. Horne, author of "Orion," a drama, and "Ballads and Romances." We might even add to the number by the names of poets still less distinguished, but that their distinction is of too limited and temporary a character to entitle them to commemoration. It happened, unfortunately for them, that they appeared at a time when the standard of poetical excellence had been raised so high, and the public mind sated with the previous profusion. It was still more unfortunate for them that they were born in such an age of utilitarianism and physical science, when even the "winged words" of poetry were outstripped by the messages of the electric telegraph, and their music drowned by the thunder of the steam-engine and the shriek of the railway whistle. But is there nothing poetical in this utilitarianism? It is the very soul and life of poetry—poetry in action instead of mere dream and reverie. The spirit is not dead; it is only changed into a nobler form, and exalted to a higher sphere. Even the railway and the electric telegraph are magnificent epics, which nothing but the highest imagination could have conceived; an Iliad has been fought in India by Havelock and Clyde, and an Odyssey travelled in Central Africa by Dr. Livingston. Such is the form which poetry has assumed among us, and by which even the wonders of past imaginations have been embodied into act and reality. It is poetry performed not written—expressed in deeds not words; and when it returns to its earlier form, the change will be indicative of a season of rest, either through utter exhaustion, or as a preparation for fresh activity.

In the preceding enumeration of the poets of this period, it will be seen that one name has been omitted, and this the most distinguished of them all. He alone is the link that connects the present day with the yesterday in which Wordsworth,

Scott, Campbell, Coleridge, and Byron dwelt among us, and as such, he well deserves the distinction of a separate notice. Alfred Tennyson is our one great poet, and in him the qualities that distinguished several of his great predecessors constitute a combination of excellence that worthily entitles him to his present pre-eminence. The public career of Tennyson commenced in 1830, when he was little more than twenty years of age, with a volume under the unattractive title of "Poems, chiefly Lyrical;" but this, and subsequent attempts, notwithstanding their high merit, failed at first to secure the public notice. It was only by the steady perseverance of a mind loving poetry for its own sake that he was enabled to overcome this general indifference; and when the suffrage of the world was at last won in his behalf, the measure of its admiration made ample amends for previous neglect. Tennyson's chief poems are "The Princess," "In Memoriam," and "Maud," and his last and most popular, the "Idylls of the King." In quantity, his productions are comparatively scanty, extending as they do over a period of thirty years; but they are distinguished by a carefulness of thought, a melody of versification, and happy selection of language, which indicate the anxious study bestowed on them, so that their appearance is only after long intervals of constant meditation and revision. Their spirit also is impressed, through such a long-sustained process of study, with a solemn melancholy, mixed with profound thoughts and earnest spiritual aspirations, that constitute the chief secret of their attractiveness and popularity. Not the least triumph of Tennyson's genius is, that he has adopted an old worn-out subject and contrived to invest it with new youth, beauty, and attractiveness. It is the subject of chivalry, and not the chivalry of the fifteenth or sixteenth centuries, when it was purified from its old rudeness and extravagance, and ennobled by the refinements of modern civilization; but the chivalry of the days of the French paladins of Charlemagne and British heroes of the Round Table—the days of errant knights, giants, dwarfs, dark forests, and flying dragons. It was thought that Tasso and Ariosto had exhausted these themes; that Sir Richard Blackmore had made them contemptible; that Cervantes had laughed them out of existence; and that the failure of even Sir Walter Scott to resuscitate them in his "Bridal of Triermain," had stamped the attempt of revival as a hopeless impossibility. But even this wondrous emprise our new poet has successfully achieved. In some of his smaller experimental attempts, and especially in his latest work, the "Idylls of the King," he has recalled from the dust of their graves King Arthur and his queen Guin-

ever, the bold knights Launcelot, Tristrem, and Galahad, Merlin the mighty enchanter, and the soldier-pilgrims of the San Graal, and clothed them with such reality and beauty, that we follow their steps and sympathize in their destinies as if they were the heroes of a present life, instead of the dreams and ghosts of an early world and barbarous state of society. In this manner to recall the dead, and invest them with fresh interest and attractiveness, was a greater feat than to create a new theme, and people it with correspondent characters. But he has succeeded because he has identified his old heroes with the feelings of modern life, and animated them with the highest aims and purest aspirations of the present day, and this too without violating the truthfulness of the picture. King Arthur is a model sovereign for the nineteenth century, and yet not less the prince of the Round Table and Pendragon of ancient Britain; and his knights become the noblest of modern gentlemen by merely unbuckling and laying aside their armour. And thus too with his heroines, so that our modern ladies can weep over the sufferings of Enid and Elaine, or kindle with indignation at the heartlessness of Guinever. Should the twentieth century produce for us a new race of poets as well as a new world, will they be as fortunate in the selection of their themes, and their treatment of them, as Alfred Tennyson?

Of the resources upon which the literature of Britain is mainly dependent, we have hitherto given no account. It will at once however be seen that, without the extraneous aid of Public Libraries, the national authorship would be reduced to very limited dimensions. For works of general scholarship, and requiring extensive research, no private collection of books would be sufficient, and even the novel or the newspaper must be sustained from other sources than the writer's imagination. But here, every literary want is supplied by the public libraries, and the liberal principles upon which they are conducted; and the student in every department of the wide range of science and literature can there find his appropriate source of information. The oldest of these great national treasures of knowledge were the libraries of the universities of Cambridge and Oxford; but independently of these, there are spread over the kingdom extensive book collections, either the property of public bodies, or the bequests of individuals, to which access can be obtained by the studious, and the resources of which are coming more into daily demand and use. For the conservation also of knowledge, and of every book worth preserving, a law was passed so early as the reign of Queen Anne, by which eleven copies of every new work entered in Stationers' Hall were presented to as

many of the chief public libraries, especially those of our universities, until A.D. 1835, when in six of these cases the privilege was rescinded, an annual sum being paid to them out of the consolidated fund by way of compensation. It was a relief not only to the publishers, who found this tax of eleven copies a serious drawback upon their profits, but to the colleges themselves, that were beginning to be deluged and all but swamped by the widening flood-gates of modern authorship.

But what may be called exclusively the great national library, on account of the magnitude and value of its collection, and the uses to which it is applied, is the library of the British Museum. Containing nearly 600,000 volumes, and 40,000 MSS., it is one of the most valuable literary collections in Europe, and in point of the number of its volumes, only second to the Imperial Library of Paris. Of these, 220,000 volumes were from gift or bequeathment, the first donor being Sir Hans Sloane, the originator of the British Museum. His bequest was followed by the royal donation of George II., who conferred upon the library, by grant under the great seal, the library of the Kings of England collected from the time of Henry VII., and manuscripts from a much earlier period; by that of George III., who enriched it with a wonderful collection of 34,000 pamphlets, contained in 2220 volumes, published in England between the years 1640 and 1660; and by that of George IV., who bestowed upon it the royal library collected by his father. Not less bountiful were the private donors, who are too numerous to particularize, one of the latest of whom was the Right Honourable Thomas Grenville, who, in 1846, left by bequest 20,240 volumes, valued at upwards of £54,000, to the Museum library. But besides these donations, the library still retains its right to a copy of every book entered in Stationers' Hall, and makes purchases of valuable libraries throughout Europe, these additions forming an increase of about 13,000 volumes annually.

So immense an accumulation in every language, of every period, and upon every department of human study, is adequately furnished for the purposes it was designed to serve, and the accommodation of those who use it. An ample reading-room, properly lighted and heated, well served by a numerous staff of attendants, and provided with all the apparatus for reading and writing, leaves the student no cause to regret that by the rules of the institution, he can only use the books within the premises, instead of carrying them to his own home. Equally liberal also are the terms of admission, so that with a simple recommendation from some literary person or even known respectable householder, an applicant is at once admitted to the full use and range of the

collection, let his rank, station, or country be what it may. Here, then, the chief amount of British authorship is daily, weekly, and yearly to be found collected, the veritable living men and women whose names only are known in the provinces, and regarded with veneration or wonderment; and here those works are elaborated which swarm from the press with an abundance and facility at which our ancestors would have been astonished. As intellect also is of no sex, here may be found among the hundreds who regularly assemble within that crystal dome, ladies mingled with gentlemen, but each pursuing his or her separate task apparently unconscious of the presence of another. One is extracting notes from a pile of volumes, or carrying on a hunt of hours or days after a stray fact, date, or name. Another is transcribing from an old smoke-dried or half-burned MS., which none can read but himself. Another is dashing on with pen in full career, and against time, in the lighter departments of literature, where imagination is half the game, and where the work of research is confined to an occasional glance at two or three volumes lying before him. What strange varieties of country, of station, of physiognomy, of intellectual occupation meet within these walls; and what results are there produced, from the ponderous folio to the fugitive essay or tale! No conversation the while—no whispering—nothing is heard but the slight rustle of the pen upon paper, or the occasional roll of the truck-wheels along the oaken floor, conveying volumes too heavy to be carried—while foreigners, astonished at such silence among so great a multitude, cannot comprehend how mind can possibly live in such an atmosphere. But it is a true British characteristic; and like the awful silence of a British battle-charge, it is the expression of confirmed, concentrated resolve. After the library of the Museum, it is the less necessary to mention the other libraries of London, conducted as they are upon a more exclusive principle, and where the books, instead of being studied upon the premises, are lent to the applicants under special recommendation. The chief of these are the Lambeth Palace, Sion College, and Red Cross Street libraries.

While England and the capital are so extensively supplied with the means of study, the literature of Scotland, although not so fortunate in royal and noble donations, has also its collections, under which the authorship of the north has grown and expanded to its present ripeness. And first of these is the Library of Advocates at Edinburgh, which was commenced in 1680, and which, of all the other Scottish libraries, still retains its right to a copy of every work entered in Stationers' Hall. Besides resembling the lib-

rary of the British Museum in this particular case, the Advocates' Library is also open to the studious, who, with a proper introduction, have free access to all its contents. As might be expected, it is especially rich in works of law; but besides this department, it possesses a valuable store of old Scottish poetry and Spanish literature. In 1849 its total amount of printed volumes amounted to 148,000, which in 1857 had increased to 172,000; and besides these, it has 2000 volumes of MSS., valuable in the civil, but especially the ecclesiastical history of Scotland. Similar to that of the Advocates', is the Library of the Writers to the Signet, containing 45,000 volumes. Still more abundant in its catalogue than the foregoing, is that of the Library of the University of Edinburgh, which possesses 100,000 volumes; but its chief value consists of its collections in every department of medical science. Such were the resources from which, in former years, and especially the earlier part of the present century, Scottish authorship principally drew its supplies, and Edinburgh became the Athens of the literary world. But the centralizing power of London, which has so greatly increased of late years, is especially manifested upon the literature of Scotland, by attracting within its own world the greater part of our northern authorship, so that the public libraries of Edinburgh and the Scottish colleges are less frequented than before.

In turning our attention to the progress of the Fine Arts, the department of Painting demands especial notice. During the preceding period, the talent and great power of execution displayed in some of the large works of Hilton, Etty, and Haydon seemed to justify the expectation of the lovers of art, that a school of grand historical painting worthy of the British nation was at last to be established among us. But this cherished hope has not as yet been realized; the advance in this the highest walk of art has not been commensurate with the progress in its other departments. The cause of this short-coming, however, is certainly not to be traced to deficiency of genius, but the want of adequate encouragement. Talents of the highest order, devoted to a production which demands the labour of years, require the fostering patronage both of church and state; and it has chiefly been by such aid that the schools of historical painting on the Continent have risen to their present eminence. But Protestantism discountenances the artistic delineation of sacred subjects, and its places of worship exclude them; while our government has only been lately awakened to the duty of encouraging the fine arts, and that, mainly, on account of their connection with our mercantile prosperity. Hence it is, that so few grand historical or scrip-

tural pictures have been produced. Another cause of this discouragement is to be traced to the scale upon which our historical paintings were generally executed. Among our artists the feeling seemed to be prevalent, that vastness of scale was necessary for the proper development of a grand historical subject, until, as in many of the works of Haydon and Etty, the human figure attained such colossal proportions, that the size of the pictures totally unfitted them for the walls of a private mansion. Our civic and public buildings also, which might have displayed them with propriety and effect, continued to have their halls unadorned with works of art, or occupied solely with the portraits of their founders and benefactors. The consequence was, that these productions remained unsold, or went a begging for purchasers at wholly unremunerative prices.

While the highest department of art was thus discouraged, an event occurred that promised to inaugurate a new era in its history, and prepare it for a fresh career. Mention has already been made of the destruction of both Houses of Parliament by fire on the 16th of October, 1834. As it was necessary to erect new buildings for the seat of legislation, it was resolved that these should comport with the grandeur of Britain in the nineteenth century, and be an enduring monument to future ages of its wealth, power, and attainments. For such a purpose the fine arts were essential; and accordingly, in 1841, a royal commission was appointed to consider how far the national edifice might be made conducive to their encouragement and advancement. The commissioners decided that the houses should be decorated with paintings in *fresco*; and in order to obtain a fair estimate of the talent that might be called forth, so that their patronage might be justly distributed, they instituted a series of competitive exhibitions. The first of these, a competition in cartoons (the preparatory designs for fresco painting), took place in Westminster Hall in 1843. The subjects selected were from history and poetry, and the figures were of life size. Eleven premiums were offered, and the trial was so satisfactory, that the number of premiums fell greatly short of the number of approved productions. In 1844 a competition in fresco painting and in sculpture was equally satisfactory; and in 1845 the actual frescoes were exhibited from six given subjects. These trials were followed in 1847 by a competition in oil painting, which was also considered to be successful. Such were the means employed by the commissioners to test the powers of our native artists in a method of painting which they had not hitherto practised. Throughout all the competitions, the premiums, with some two or three exceptions, were awarded to young, and at that time comparatively un-

known artists, few of established reputation having taken part in the competition. Such was the result of one portion of the plan of the commissioners, which, in its whole extent, comprehended a vast scheme, in which painters, sculptors, and decorators of every kind should be employed, and the fine arts developed and advanced in all their different departments. The establishment of painting in fresco as an ordinary and familiar method with our artists, which it has so greatly tended to promote, is of itself no mean achievement in the progress of British art. It is true, indeed, that in the paintings for the houses, little has as yet been effected, the few frescoes already executed being but a small portion of the contemplated work, while most of them have failed to become popular. But it is not difficult to account for this disappointment. Of the subjects, some have been selected from so remote a period of our history, that the public no longer remembers them, or has ceased to sympathize in them; while others are mere idealisms or allegories, which none but the designer can understand or the interpreter explain. Still we do not, and we need not, despair. The failure, if failure there has been, is only temporary. The spirit that has been awakened, and the national encouragement by which it is animated, will, we doubt not, so advance the art of historical painting among us, as to exalt our artists, at least to an equality in this department with those of Germany and France. The effect of the competitions for the adornment of the Westminster Palace is not to be estimated from the pictures on the walls alone, but from the impulse it has conveyed and the emulation it has kindled. It is much that the fine arts should at length have found such a great national field for their arena of trial and display, with a whole nation for the on-lookers and rewarders.

While the progress of historical painting, taking the term in its highest sense, was so inadequate, and its sphere so limited, it was natural that artists who would have chosen this department, should seek a safer and more remunerative outlet for their particular tendencies. Those therefore who devoted themselves to the delineation of the human figure, and the expression of human action and passion, betook themselves to scenes of domestic interest, or the illustration of the poems and novels of the most popular writers. In this way, the works of Shakspeare, Milton, Cervantes, Molière, Le Sage, Goldsmith, Scott, &c., which afforded so ample a scope, were largely drawn upon by our artists. But latterly this profusion had somewhat sated the public taste; a general craving followed for something more fresh and original; and the artists themselves were ready to

respond to the call, by entering into a wider field, and illustrating the drama of life with a deeper comprehension of its universal interest and boundless variety. Instead, therefore, of painting at second hand the ideas of life and action as presented by certain favourite authors, they now aim at original illustrations of the ever-varying phases of society. Many pictures have thus been produced of late years full of profound thought, tender pathos, cheerful vivacity, and quiet humour, honourable alike to the just appreciation of human nature, and the high professional skill of those who produced them.

Independently of this original spirit in design, a great advance in precision of drawing and carefulness of execution has been accomplished during the last thirty years. Among some of the most successful artists of the early part of the present period, and particularly those of the Scottish school, the necessity of definite drawing and correct detail seemed to be held in little account. This was especially the case in landscape painting, where a loose generalization was adopted, which, though not seldom productive of a highly poetical expression, fostered a careless and slovenly style of execution among younger artists, and greatly tended to vitiate the public taste. But, happily, the representatives of a more correct school of art predominated, men who could draw with accuracy and precision; and since their example obtained the ascendancy, the evil has been checked, and the current turned into the right direction. Thus, the drawing of the British school is already greatly in advance of its former position; and although to correctness of form greatness of style has yet to be added, we doubt not that the onward progress of taste will soon lead to this more difficult attainment.

At this point we may advert to a new system of art that has arisen among us, by which further progress in poetical creations of beauty and grandeur has been threatened with a most unwelcome impediment. We allude to what is called pre-Raphaelitism, the great artistic heresy of the present day. A knot of painters, who assumed the singularly inappropriate name of pre-Raphaelites, have propounded, both by their paintings and writings, such principles of art as would reduce the artist to the most prosaic of mortals. The veritable Italian pre-Raphaelites at the end of the fifteenth century were the most ideal of painters; their modern representatives are the most material and naturalistic. In opposition to the imaginative in painting, which, in addition to poetic conception, demands selection of objects, harmony of arrangement, and all the graces of style, the pre-Raphaelites of the modern school taught that nature in its most material and ungainly forms was to be copied

with implicit exactness. In their first productions this doctrine was rigidly fulfilled; and the public were astounded by pictures in which the total absence of beauty of form or the graces of composition were combined with the most pains-taking accuracy of detail and excessive minuteness of finish, and in which accessories, hitherto inadmissible in works of art, were obtruded with ostentatious distinctness. Their theory seemed to regard the beautiful as a temptation and a snare to beguile them into the dangerous paths of idealism, and models beneath the standard of nature's beauty came to be recognized as the most fitting subjects for their pencil. Here, too, the evil did not stop; for notwithstanding their eccentricities, these artists were men of earnest purpose, and some of them gifted with high abilities; and, however repulsive might be their earlier productions, it is not to be denied that they evinced great power, and sometimes possessed a quaint deep tenderness that almost redeemed their ugliness. Of late, more than one of the pre-Raphaelite brethren have given striking evidence of a renunciation of their first faith, by productions which, while still retaining all the meritorious accuracy and high finish of their earlier pictures, are poetical creations marked with deep thought and tender sentiment. That they have the power to confer benefit upon British art may be fairly assumed; and when they abandon the trite, the vulgar, and repulsive, and paint nature in her greatness and beauty, they may achieve for themselves a high position which shall be universally, and not merely *partially* acknowledged.

As our artists are so numerous, and their qualifications so various, we must confine ourselves to the general indications they have given during the last thirty years, and this too with a very summary notice. We have already stated that the *genre* pictures of the British school of painting hold one of the highest places among kindred works in Europe; and in regard to colour and effect, they are in advance of most of the modern continental productions. In marine painting—a department in which it ought to excel as a national distinction and characteristic—it may be said to occupy the first rank, being scarcely equalled by the productions of the French school, which approaches nearest to our own in excellence. In landscape, the rich scenery of the south, and the picturesque grandeur of the north, with their rapid changes of storm and sunshine, have had an inspiring effect upon our painters, whose productions in this class of art are not surpassed by those of any other nation. This excellence is especially apparent in their faithful realization of daylight and the varying effects of the atmosphere, qualities in which they very

favourably contrast with the recent works of France and Germany. In portraiture, much of the old conventionality prevails; and while an occasional effort is successfully made to abandon stereotyped arrangements and formal positions, for a better pictorial treatment, the portrait painter still seems to be too readily satisfied with a mere faithful presentment of his sitter. But in spite of these perpetuated drawbacks, which seem common to this department in every country, the British school of portrait painting still holds a respectable rank in art. To our animal painters the highest praise may be accorded. It is true, indeed, that in this department our artists have not yet reached the dash and vigour of the animal painting of the great school of Brabant, but on the other hand, they excel these old artists in natural expression, refinement, and vivacity.

While the progress of the British school of painting has been on the whole so satisfactory during the present period, and so full of promise for the future, the new invention of photography, which at first seemed to threaten a diminution of the artist's occupation, has been one of the elements operating upon this improvement; and by reverting to our previous notice of this invention, the manner and character of its operation upon art will at once be perceptible. The exactness, minuteness, and finish of sun-drawing, and the readiness with which a sun-picture can be taken and transferred to the artist's portfolio, to be studied at leisure, have reduced the careful study of nature to a less onerous task. By this process, the precision of form and disposition of light and shade are brought vividly and continuously under his notice, and an increased facility and power in reproducing them imparted. Hence the importance which is now attached to photography as a separate department of art, and the care with which it is cultivated and improved in all its branches. And while its delineations have tended to raise the standard of excellence in drawing among the artists themselves, the effect they have produced upon the popular taste at large, if less apparent, has not been less decided. In almost every street of our principal cities, photographic specimens of landscape, architecture, and portraiture arrest every eye; and the crowds that are familiarized with them are insensibly acquiring a correctness of taste which will no longer be satisfied with mere showy and superficial generalities.

In the history of the British school of painting during the middle of the nineteenth century, and the means adopted to elevate the general taste, the public collections now demand especial notice. And first of these is the National Gallery of Paintings, the earliest of our govern-

ment institutions for the promotion of the arts, but which did not originate until 1824, when parliament voted £57,000 for the purchase of Mr. Angerstein's collection; and this, with Sir George Beaumont's valuable collection, which he presented to the nation, was to form the nucleus of the National Gallery. The first consisted of thirty-eight, the last of sixteen pictures, most of them the productions of the old masters. For some years the collection went on slowly, being chiefly increased by donations, the most important of which was the bequest of the Rev. Holwell Carr, of thirty-five pictures, all of them, except one, being valuable productions of the old masters. In 1858-59, the gallery contained 330 pictures, of which 154 had been purchased, and 176 presented or bequeathed. This is no doubt but a small number as compared with the galleries of the Louvre, Dresden, Madrid, Berlin, and Munich; but considering its intrinsic value, and the short period of its existence, it does not need to shrink from a comparison with any foreign gallery. In 1847, Mr. Robert Vernon presented to the nation his collection of 157 pictures, all of them except two being by British artists alone. They were generally of more than average excellence, and some of them of very superior merit, and of themselves were well fitted for the commencement of a gallery of native art. Of still higher importance was the Turner collection, bequeathed by that prince of landscape painters to the British nation in 1851, and of which mention has already been made.¹ It is formed entirely of his own productions, and consists of 100 finished paintings in oil, some hundreds of finished water-colour drawings, and several thousands of studies and sketches; and these he bequeathed upon the easy condition that within ten years a suitable place should be prepared for their accommodation. Next in order of time was the donation of the Sheepshanks' collection, which was presented by Mr. Sheepshanks to the nation in 1857. It comprises 234 oil paintings, the productions of our best British painters, ranging over a period of fifty years; and is especially rich in the productions of Leslie, Mulready, Stothard, Collins, Webster, and Landseer. It was stipulated by Mr. Sheepshanks, that a well-lighted and otherwise suitable gallery, to be called the "National Gallery of British Art," should be forthwith erected by government, in which his pictures should be kept, with whatever other paintings might afterwards be contributed. In consequence of this stipulation, a convenient and well-lighted building was erected at South Kensington, in June, 1857, and opened to the public, free on certain days of the week, and for a small fee on the

¹ Vol. iv. p. 477.

other days of the week, when students are admitted. By these Turner, Vernon, and Sheepshanks' collections, and the specimens of native art originally belonging to the National Gallery, many of the best specimens of the British school, extending from Hogarth and Reynolds to the close of the present period, have been brought together and preserved for public use.

Closely connected with these collections is the "National Portrait Gallery," the chief aim of which is not so much to cultivate the public taste in art, as to animate the national patriotism by a commemoration of the great and good characters by whom our public annals are adorned. The veritable likeness of such personages is contemplated with emotions not only irrespective of artistic feeling, but of nobler and higher character, and the exhibition of such a series of silent portraits will ever be more available with the bulk of the community than the most eloquent harangues and eulogies. The want of a gallery of this kind had long been felt, and the subject being brought before government by Earl Stanhope (then Lord Mahon) in 1856, a grant of parliament was made to the amount of £2000 for furthering such a national object, and the institution itself was commenced at the end of the following year, with twenty-three portraits, fifteen of which were purchased, and eight were donations. In 1858 thirty were added, of which eighteen were obtained by purchase, and twelve by donation. As a "National Portrait Gallery" ought to be a Valhalla, into which nothing but genuine worth and greatness should find admission, the rules of selection have been made sufficiently stringent. The portrait must not only be an authentic one, but the original must have been a British worthy in the true sense of the term. When a donation is offered, the approval of at least three-fourths of the trustees is necessary for its acceptance. To guard the selection also from artistic bias or party prejudice, the trustees are composed not merely of artists and connoisseurs, but of historians, antiquaries, politicians, men of every party, but considered to be free from sectarian or party exclusiveness. And that time sufficient may be given to test the worth of every candidate for a niche in this temple of fame, it is decreed by their second regulation, that "no portrait of any person still living, or deceased less than ten years, shall be admitted by purchase, donation, or bequest, except only in the case of the reigning sovereign, and of his or her consort, unless all the trustees in the United Kingdom, and not incapacitated by illness, shall, either at a meeting or by letter, signify their approbation." The parliamentary grant of £2000, which is to be annually continued, insures funds for the necessary purchases. This National Gallery was first

VOL. IV.

opened to the public on the 25th of January, 1859; the number of portraits which it contained at the close of that year being ninety-seven. Were but the portraits of the British worthies contained in the British Museum, Hampton Court, and the National Gallery, added to this collection—a wish which probably may yet be fulfilled—our "National Portrait Gallery" would be worthy of the nation that has produced such men, and the liberality and public spirit with which such memorials have been accumulated.

Two galleries of paintings still remain to be mentioned, which, although not strictly national property, are yet open to public inspection. The first of these is the collection of Hampton Court Palace, chiefly formed by bringing together the pictures from the other royal palaces, and which for these twenty years has been freely thrown open to the public. It consists of 1850 pictures, among which are the seven cartoons of Raphael, of themselves sufficient to give a character and standing to any collection. While many of the pictures are of inferior merit, there are fine specimens of the Italian and Dutch schools, and the collection is rich in the works of foreign artists who practised in this country, including those of Holbein, Vandyke, Lely, and Kneller. The other is the Naval Gallery of Greenwich Hospital, founded chiefly by Mr. Locker, one of the commissioners of the hospital, in 1823. It is a truly national collection of the portraits of our distinguished naval commanders from the days of Hawkins, Raleigh, and Drake, ending with Nelson, his contemporaries, and immediate successors; and of the pictures of our great sea-fights, from the destruction of the Spanish Armada to the battle of Trafalgar. This valuable collection consists entirely of donations; and as soon as the plan was proposed by Mr. Locker, George IV. enriched it with portraits of English admirals from the collections in Windsor Castle and Hampton Court, an example which was soon followed by private individuals, so that the gallery is rich as a biographical record of historic worth and heroic associations. The sight-seers of London and their numerous visitors, in consequence of the opening of these two galleries, have now made Greenwich Hospital and Hampton Court the favourite places of their holiday pilgrimages.

While so much has been effected in England for the improvement of art in so short a period, a similar movement, though in a more limited degree, has been going on in Scotland, and Edinburgh as well as London possesses its National Gallery of Paintings. The building for the purpose, one of the choice architectural ornaments of the city, was erected partly from funds supplied by the "Board of Trustees for Manufac-

tures in Scotland," and partly from a grant by government. The foundation stone was laid by the prince consort on the 30th of August, 1850, and on the building being completed, it was opened to the public in 1858. The collection consisted of—1. The pictures collected by the directors of the Royal Institution, and first exhibited to the public in 1831; 2. The pictures, bronzes, &c., bequeathed by Sir James Erskine of Torrie, to the college of Edinburgh, and deposited with the board for exhibition, under a deed of agreement; 3. The collection of ancient and modern works, commenced in 1829 by the Royal Scottish Academy; 4. Pictures, the property of the board, acquired either by purchase or gift for the National Gallery; 5. Modern works purchased by the Royal Association for the Promotion of the Fine Arts, with funds set apart for this purpose by their charter; 6. Pictures deposited or lent for fixed periods. The whole collection amounted to 294 paintings, and 37 marbles and bronzes, but lately it has received several valuable additions. It is a worthy pendant to those larger galleries of art in London which belong to the empire at large; and as a school of study, it bids fair to promote that artistic excellence in which Scotland, although the latest of kingdoms to enter into the competition, has already done so much.

The opening of picture galleries to the public was calculated to do much towards extending a just appreciation of works of art among all classes of the people, and to stimulate a desire to possess objects affording such pure and elevating enjoyment. But good pictures are costly luxuries, which only the rich can afford, and even the more ordinary and unpretending productions of the easel were within the reach of a comparatively small section of the community. Hence the establishment of Art-Unions, which have been multiplied throughout the kingdom, and the productions of which are to be found upon the walls of every house of ordinary pretensions. Their commencement was in Edinburgh by a few private individuals in 1833, when a society was established under the name of the "Association for the Promotion of the Fine Arts in Scotland." This example was followed in England by the establishment of a kindred society in London in 1837; and the impulse thus given was soon followed by the principal cities of the United Kingdom, each establishing an art-union of its own. The purposes of these unions are twofold: the first, to encourage artists by giving liberal prices for their best productions; the second, to place within the reach of all, really good examples of the arts of painting, sculpture, and engraving. These aims are secured by the committee of the art-union, and the money contributed by the

subscribers. Their plan of operation, as first proposed, was limited to the purchase of pictures and the disposal of them among subscribers by lottery; but it was soon found expedient to offer something more than the mere chance of obtaining a painting. Accordingly, one of the best prize pictures, or some other work of excellence, was selected for engraving, and a copy of the print given to each subscriber—who has thus not only the chance of winning a valuable painting, but the certainty of getting an engraving fully worth the amount of his subscription.

The history of the progress of these art-unions has strikingly manifested their acceptability, as well as the greatness of the want which they were designed to satisfy. At their commencement in this country, their operations were mainly confined to the localities in which the several societies were established. But of late years their operations have been so extended as not only to comprise the whole British islands, but a great part of our colonies also. From this circumstance, the engravings they have produced have been very widely disseminated, while it has not unfrequently happened that one of the leading prizes has fallen to the lot of a person residing in Australia, the West Indies, or the Cape of Good Hope. The patronage they have extended to art, and the influence they have exercised, may be surmised from their monetary statistics. At its first allotment of prizes in 1834, the Edinburgh society had raised for the year, £728, while in 1859 the subscriptions for the year had reached £5894. In 1837, the first year of its existence, the London society raised £489, while in 1859 the annual subscription had risen to £15,210. In 1841, the first year of the Glasgow society, the sum raised was £1224; but in 1855, the year when the subscriptions had reached the highest point, they amounted to £20,281. From its commencement in 1837 to 1859 inclusive, the total amount raised by the London society was £254,143. Of this sum, £138,662 was expended on paintings and other works as prizes, and £64,624 on the production of engravings, the balance of the sum collected being required to defray the working expenses.

While art-unions have grown so great and achieved so much, it has been objected, that the tendency of these institutions is to degrade art by the temptation they hold out to artists to lower their works to the standard of a popular taste as yet young and immature, and to be more solicitous to impart to their productions those showy superficial qualities that will suit the market, than those which a cultivated judgment is needed to appreciate. It is also asserted that the engravings, whatever may be their intrinsic value, become worthless by their

profuse distribution. But to the first of these objections it may be answered, that not only is the possession of a *mediocre* picture better than none at all, but that the growing knowledge and discriminative judgment of those who choose the pictures, whether they be the union committees or the subscribers themselves, are an ever-increasing safeguard against this depravity of choice. And with regard to the engravings, a very slight consideration suffices to show that the object of art-unions can only be attained by the engravings becoming common; that their aim is, that such works may no longer be reserved for the delectation of the wealthy, but diffused among the homes of the middle classes, and even those of inferior grade; and that from these household ornaments aspiring genius should early become conversant with the true and beautiful in art. And that such a result is the necessary consequence of art-unions, picture-galleries, and other such public institutions, has been evinced during the last thirty years. Their combined influences upon the people at large, and the increasing demand they have created, have made the present period remarkable for the profusion and variety of its art products. At no former time was there even an approach to the countless productions in engraving, lithography, statuary, and photography, of every variety of excellence, that now issue forth in such abundance; and it may already be asserted, that art, though in a form sometimes lowly enough, has found its way into every household, and thrown its silent influence, whether immediately or indirectly, over every mind.

In this brief sketch of the history of painting during the last thirty years, we have contemplated the cultivation of art for its own sake, and with reference to the pleasureable emotions of which it is so pure and so fertile a source. But in such a practical and utilitarian age as the present, something more than the mere luxurious sentimentalism and poetry of art was demanded. It was found that while our manufactures had been so greatly improved and so widely extended, we were still decidedly inferior to the continental nations in all that relates to beauty of form, design, and decoration, and that this inferiority depreciated certain classes of our manufactures in the foreign markets, where those of France and Germany, although not intrinsically better, obtained an unmistakeable preference. This fact bearing so closely upon the national prosperity, naturally impressed itself upon our government, and originated a very important branch of state patronage—the establishment of government Schools of Design for the education of designers employed by manufactories in an adequate knowledge of ornamental art. These

schools were first established in 1837, and after undergoing many changes, they have at last subsided into a *department* under the Committee of Council for Education. Originally instituted as schools of design, not only art, but even processes of manufacture were attempted to be taught in them: they then became “schools of ornamental art,” and they are now Schools of Art, in which ornament constitutes one of the branches of education, and many elementary drawing schools are now connected with them. It was full time indeed to originate such an improvement; for until the establishment of these schools, our pattern-makers were almost our only designers. With the application of a design to the technical requirements of a specific manufacture they were quite familiar; but through want of a proper education they were utterly inadequate to its original production. Hence it was that the patterns in English manufactured goods were either modified copies of designs prepared for other purposes, and often sadly misapplied by the transference, or actual copies from patterns on foreign fabrics.

The influence of these government schools of art, and others that had sprung up in connection with them, was soon perceptible in the improved taste exhibited in our manufactures; but the competition in the Great Exhibition of 1851 sufficed to convince us that much greater improvement might still be effected. The mechanical skill displayed in the specimens of English manufactures was universally recognized; but this was contrasted by their inferiority in point of design—their design and decoration being to a very large extent either puerile attempts at originality, or adaptations in the worst French taste, the *Rococo* or debased Louis-Quinze style—a style which the French themselves had generally forsaken for the ordinary *Renaissance* of the period of Henry IV. But the Great Exhibition of Hyde Park gave a lesson upon the subject which our manufacturers were not slow to learn, and the improved taste that has since appeared in manufactured goods and ornamental articles is abundantly apparent. In this application of art to the practical and useful, the manufacturers of articles in pottery and glass have taken the lead, but closely followed by the workers in iron, in bronze, and in brass. Then succeed our workers in the precious metals, bookbinders, house decorators, and manufacturers of textile fabrics; while the rear is brought up by the makers of house furniture and cabinet work, in whose productions the improvement, although as yet the least decided, can still be distinctly recognized.

After this general sketch of the history of British art in painting during the last thirty years, the other departments of the fine arts may

be dismissed with a brief notice. In Sculpture, our artists of the day have not fallen behind their predecessors; and their productions, whether in portraiture or the ideal, still maintain the high reputation in grace, beauty, and truthful delineation, for which they had become distinguished. Our inferiority, however, in public and national monuments still continues to be complained of, notwithstanding the few happy exceptions with which some of our principal cities and churches are ornamented. Sculpture, indeed, has never attained the popularity of painting; and the cause of this may be found in its fewer resources and more limited range of expression. In Britain, also, these disqualifications have been seriously increased by the wearing nature of our climate and the iconoclastic character of our people; so that hitherto our public statues, which might have contended with the war of the elements, have been injured or defaced by rude popular violence or thoughtlessness. But even already the era of a better feeling has commenced, that can appreciate the productions of the sculptor as well as those of the painter, and our monumental statuary is indicating the effects of this revival. It is, indeed, no small encouragement to those who work in stone, marble, or bronze, that their commemorative or national productions can be set up without being smeared by rude pencillings, or scratched with knives, and that, whether under cover or in the open air, the image is as safe as the living man. Among our recent productions of this nature, Foley's equestrian statue of Lord Hardinge, executed for Calcutta, speaks much for the growing improvement of this department of sculpture in Britain. The same may be said of the twelve statues in marble of leading members of the House of Commons, from Hampden to Grattan, executed under the superintendence of the royal commission of the fine arts, and lately placed in St. Stephen's Hall, Westminster. They attest the dawning of a better spirit in the style of our monumental sculpture, and present a happy combination of the realistic and ideal. It has hitherto been unfortunate for sculpture, as it was for painting, that its revival in a Christian age was too exclusively based upon the mythological creeds and somewhat loose morality of ancient Greece and Italy. This practice of sculptors, continued to our own time, in their choice and treatment of subjects, has hindered the general popularity and acceptability of their works. Not a few of them seem to think that the naked or semi-naked human form is almost the only object fitted for the employment of their art; and in consequence of this erroneous impression, they continue to produce what are called classical subjects—subjects drawn from antique history and mythology, with which only the

scholar and connoisseur can sympathize, and the titles of which are little else than apologies for the exhibition of undraped humanity. Other sculptors, however, under a wiser inspiration, have turned their attention to the heroines of our British poets; and in these, as well as in kindred imaginative works, drapery is as freely used as the nature of the subject demands, and truthfulness thereby imparted, without the sacrifice of ideal beauty and lofty sentiment. Learned critics may differ on the relative merits of the two classes of sculpture to which we have adverted; but certain we are that there can be no question as to which of them is most in unison with the taste and requirements of the present day. In descending from original and monumental, to reproductions in sculpture upon a miniature scale in Parian porcelain and metal by electro process, we only allude to a well-known source of domestic enjoyment by which so many homes are adorned, and by which a taste in statuary promises to be as highly and as widely cultivated as that which prevails for painting.

In Architecture, the national progress during the last thirty years has not corresponded with the general movement, notwithstanding the imposing buildings which everywhere meet the public eye. Stately halls for the accommodation of literature and science, palaces and palace-warehouses, lyceums, athenæums, and gymnasia, continue to rise in increasing rapidity, each eclipsing its predecessor, and attesting the growth of our wealth and the increase of our public spirit; while the general conclusion continues to be repeated, that all has not been realized as yet which might have been expected. But although much of this complaining may be referred to that captious spirit of discontent which abundance is so apt to create, it must be confessed that there is still ground enough for dissatisfaction. The chief causes of our short-comings in architecture are also not far to seek: they are legibly impressed upon our public buildings, which, however stately or imposing in their appearance, are chiefly copies or imitations of an early period of society, rather than original designs correspondent to the middle of the nineteenth century. Our architects, instead of daring to think for themselves, and follow out a style of their own, still timidly confine themselves to the lessons of the old schools; and the result is imitations of the classical, but especially of the mediæval and revival periods of architecture, in which faithful copying or clever adaptation is the highest merit. This imitative spirit has been especially evinced in the revival of the Gothic style, which now predominates in our new ecclesiastical edifices. The increase of the population

and still more, the general revival of religion in Britain towards the close of the last century, had turned the public attention to the building of new churches, while the Gothic, exclusively termed "the Christian architecture," was subsequently reckoned the fittest style for their construction; and this feeling was further deepened and confirmed by the increasing Popery and widely-spreading Puseyism of the last thirty years, which identified religion with the form of worship that had prevailed during the earlier stages of Christianity. And yet, instead of being the exclusive type of the Christian faith in stone and lime, the Gothic, it is well known, only commenced at a late period of ecclesiastical history, only predominated a few hundred miles to the east and west of the Rhine and in England, and was not matured until the beginning of the fourteenth century. In the revival of this style, which has now been continued for forty years, the vastness and enduring solidity from which the ancient sacred edifices derived their grandeur and imposing appearance, have to be sacrificed to the principles of modern utilitarianism, so that our new cathedral structures have the aspect without the substance of their massive time-honoured predecessors. But still, much has been done by this revival of Gothic architecture both in the renewal of old churches and the construction of new; and until a better style is created, it will continue to satisfy the public taste, as the one most in harmony with religious feeling, and the fittest type of what is reverentially termed "the house of God."

But the great and enduring monument of British architecture in its present state of transition, is that stupendous and magnificent building, the Palace of Westminster, commenced in 1840, and now completed after a labour of twenty years—a short period compared with its colossal magnitude and infinity of detail. It covers an area of more than eight acres of ground, contains 1100 large apartments, and more than 100 staircases, while its corridors and passages comprise a journey of two miles. The height of its towers, which are among the loftiest as well as the most massive in Europe, is more than equalled by the architectural and engineering skill that had to dive deep into the precarious soil of a river's bank, to lay a foundation adequate to sustain such a mountain of stone. To enter into the details of such a vast superstructure would be superfluous, not only as they are so numerous, but as each is more or less the subject of criticism and controversy. We can only state, for the present, that a twenty years of labour, and more than £2,000,000 of expenditure, bid fair to be repaid by the grandeur and beauty of this national pile; and that almost every change in the

original plan—and they were numerous—instead of being dictated by a niggardly economy, only tended to increase its magnitude, its splendour, and its cost. Of course, a diversity of opinion exists, and will continue to exist, upon the architectural merits of the Westminster Palace, and what one party of critics will applaud as striking beauties, will be equally decried by another as striking blemishes. But all will coincide in the declaration, that as a whole, it is the masterpiece of our modern architecture, and the fitting monument of our national wealth, enterprise, and liberality.

After mentioning the Westminster Palace, we might advert to the other public works which have arisen in such abundance during these thirty years. But to all of them, unfortunately, the same objection more or less applies, that they are but *refaccimenti* of old styles, instead of the creation of a new; and that they would apply as fitly to any preceding century as to the nineteenth. Even that palace itself, with its imposing aspect and rich variety, is, after all, an Italian design with medieval details;—the master-piece of some of our best buildings, which display an original genius even in adaptation. Such is the condition of architecture as one of the fine arts, notwithstanding the numerous public edifices, and splendid mansions of the wealthy and the noble which have been reared during the present period; and however social and domestic comfort may have been improved by their internal arrangements, the outside is a resemblance of what has been accomplished in an earlier and ruder day. But even already this servile spirit is abating. The desire of improvement in this, as in other departments, is impatient for a new and better development, and there is genius enough among us, when thus aroused, not only to plan works of constructive skill, but to combine the scientific and the useful with what is truly beautiful and pleasing. A step in advance to this change was the Institute of British Architects, which was founded about the year 1835, "for facilitating the acquirement of architectural knowledge, for the promotion of the different branches of science connected with it, and for establishing an uniformity and respectability of practice in the profession." Another important step has been the use of iron in building, by which gracefulness and lightness are combined with strength and stability, and new forms imparted to which stone is inadequate. In such indications, we detect a hopeful spirit of change and the promise of architectural improvement, in which Grecian temples and Gothic cathedrals will no longer be the only types of excellence.

Of the progress of Music during the present

period little can be said. During these thirty years, no musical composer of note has appeared in Britain; and in the absence of original productions of our own, we have been obliged to content ourselves with those of Italy and Germany. It was otherwise both in England and Scotland three centuries ago, when each country had a national music of its own, and a musical spirit that seemed to insure a succession of musical geniuses equal to their poets. But this commencement so full of hope was not developed, and during these hundred and fifty years, music as a science has been almost wholly thrown aside, and the voice of national song either silenced, or converted into dissonant bawling. To account for the arrest after so much promise, several theories have been offered; but if we remember that this cessation was coincident with the rise of our commercial spirit, the true solution may perhaps be discovered. An earnest spirit was awakened, in which substance not sound was the object of pursuit: the notes of the banker superseded those of the minstrel, and every sweet sound whether of wind or string, was drowned in the clink of gold and silver. Thus, while we became the wealthiest, we also became the least musical of nations; and when we could no longer create music of our own, we were contented to buy it from our neighbours, along with other foreign luxuries. Such in general terms may be accepted as the history of British music till near the close of the preceding period, when a new effort was made to revive it by public concerts, and societies formed for the cultivation of the science, and the promotion of its practice among the people at large. Nor were their efforts unsuccessful. These attempts to popularize the subject were apparent even in our village clubs and common street minstrelsy, and the general ear was awakened with harmonies to which it had long been a stranger. To be convinced of the greatness of the change, let any one but recollect the music of our streets as it existed some forty or fifty years ago, and compare it with that of the present day.

This recall of the national spirit to its old affection could not pass unnoticed, and it was hailed by sincere lovers of their country as the best means of national improvement. It was hoped that the charms of music would banish the desire for grosser indulgences, especially among the lower orders, and prepare them for the operation of better influences: and accordingly, the attempt was made nearly twenty years ago to establish vocal music in our schools as a branch of popular education. The system patronized by government was that of Wilhelm, adapted to English use by Hullah; and from the

simplicity of this method, it was hoped that boys and girls would learn to sing, without waste of time and with little effort. "Schoolmasters," says an English clergyman, "according to the more merciful spirit of modern discipline, were to beat time instead of beating their scholars; and schoolmistresses were to instruct their respective charges in the art of calculating intervals, as well as counting stitches. Every little urchin was to learn sol-fa-ing as soon as he had got through his A B C, and crotchets and quavers were to become as familiar to him as pot-hooks and round O's." The effects of this teaching, although not all that was wished or even hoped for, have still been so far satisfactory, that they have created a general tendency in favour of music which will lead to higher proficiency, and may eventually produce native composers not unworthy to be classed with the great German and Italian masters. For the present effects of this tendency we have only to instance the numerous concerts of our towns, the superior style of their performances, the critical discrimination they have kindled, and the relish with which they are enjoyed—as well as the eager crowds who repair to them, and the very moderate prices by which they are changed from a rare and costly luxury into an enjoyment of which all can partake.

In the present chapter we have purposely omitted the department which properly comes under the term of "Manners and Customs;" and the cause of this omission it will be easy to surmise. It would indeed be superfluous to detail to the present generation the forms of their own domestic life, and their social habits and amusements, which will only be interesting and instructive to our successors, to whom therefore the task of recording them may be bequeathed. But one great feature of the present age cannot thus be passed over in silence. We allude to the great Volunteer Movement, which has converted so large a portion of our citizens into soldiers, our island into a camp, and our public offices into barracks as well as places of business. This, also, the latest as well as the most important of our national events, will form an appropriate termination to our history.

Notwithstanding our victories in the Crimea and India, an impression had been forced upon us by the occasional blunders and disasters of these campaigns, that our military organization was far from being complete. It was also felt that war as a science was assuming a new form, which we should do well to study for the sake of our national safety and stability. This necessity was all the more urgent in consequence of the independence of wind and tide which steam had given to navigation, by which we might be in-

vaded at unawares, and compelled to fight the battle at our own doors, and for our very existence. The provident alarm upon these subjects was so general, that all parties of the government were obliged to yield to it. The state of our land and sea defences was therefore the chief subject of consideration in parliament during the year 1859; and the facility with which Britain might be thus visited, as well as our insufficient state for resistance, was very generally acknowledged. It was from France that the chance of invasion was to be apprehended. Notwithstanding our new and intimate alliance with that country, the defeat of Waterloo had never ceased, it was alleged, to rankle in her recollection, and provoke a desire for retaliation—nay, even our defenceless condition was of itself a sufficient provocation to a people so devoted to war, and so subject to act upon the changeful impulses of the moment. Should it come then to this crisis, which it might at any hour, the chances would be greatly against us. When one nation, it was remarked in the House of Lords, determines to apply all her energies to making money, and another to making preparations for war, it is obvious enough with which of the two nations the money will ultimately be. The idea, indeed, of France effecting the permanent conquest of Britain, was scorned by all parties as a disaster too great to be imagined, and the final expulsion of the invaders from our shores was regarded as a certainty; but in the meantime, a successful march upon London, and the destruction or sack of our metropolis, would, independently of the lasting disgrace, inflict such a loss upon the nation as a whole century might be insufficient to repair. And with what facility such a blow could be inflicted was shown, not only by the military resources of France, but the efficiency of its navy, which already was equal, if not superior to our own. Thus, the French, as was observed by Lord Palmerston, could bring an army together, place it on board without exciting observation, and land it in a few hours on our shores. In the same spirit, the peaceful professions of the French emperor, and his obvious interest to maintain a friendly connection with Britain, were met and answered. He ruled by the popular suffrage, and might be compelled to yield to the popular wish. He could not be relied on, because he was placed in a position in which he could not rely upon himself. He must be governed by circumstances, and it would be wrong to leave our country to the mercy of such contingencies. Let us but put ourselves into a state of preparation for a successful resistance, and even Louis-Napoleon himself would rejoice, as it would furnish him with the best of arguments to his

subjects against any such attempt. Such were the principal arguments adduced in favour of the means of security and defence to be adopted by government, and which were now officially announced by the Earl of Ripon, the under-secretary of state for war. Volunteer corps were to be enrolled throughout the whole island. To promote the purposes of this enrolment, it was the intention of government to issue twenty-five stand of arms to every hundred men (subsequently increased to arms for each man), on the four following conditions:—That a safe range of 300 yards should be provided for practice; that a proper place should be appointed for keeping the arms; that the rules of each corps should be sanctioned by the government; and that a periodical inspection should be made by a proper military officer. In the event, however, of an actual invasion, the government would be prepared to supply every corps with arms. Drill sergeants from the disembodied militia should be provided for each corps, who would be paid, not by the government, but by the corps themselves. It was intended also to allow a limited number of members of the corps, at their own expense, to attend the school of musketry at Hythe. The government likewise contemplated the formation of artillery companies, which would be supplied with instruction, guns, and ammunition, by the royal artillery. The weapon of the new embodied militia was to be the Enfield rifle. The government plan, which was thus announced on 1st July, 1859, was accepted by all parties as the most expedient arm of national defence, and a circular, dated 13th July, authorizing the formation of volunteer corps of rifles and artillery, was despatched from the war office to the lieutenants of all the counties of the United Kingdom.

This decision was nothing more than a response to the general wish, expressed in many an ardent petition as well as offer of gratuitous military service; and, as soon as the royal assent was announced, corps were formed, standards raised, and the work commenced. Everywhere was to be seen the march and countermarch of the new levies; everywhere was to be heard the clang of the bugle and the crack of the rifle. The rapidity with which the fields and waste grounds of our island were arrayed with armed battalions, and the military precision which soon pervaded the evolutions of these citizen-soldiers, dispelled every fear of invasion and every surmise of insecurity, and foreigners themselves were obliged to confess the innate heroic spirit of the British character, and how promptly a "nation of shopkeepers" can be changed into a nation of formidable warriors. It was the rising of a people fearless of danger, and possessing

more than others what was well worth defending. To test the proficiency of the corps of the different districts, and encourage their military ardour by a great national review under the eye of royalty, a display of this nature was given on the 23d June, 1860, at Hyde Park, composed of 20,000 volunteers. The stalwart forms, gallant bearing, and admirable discipline of this uncompelled, unhired soldiery, and their military obedience combined with their consciousness of moral freedom, was a spectacle which perhaps no country but our own could have exhibited in such perfection. It carried the mind back to the days of the Commonwealth, when the London trainbands, derisively termed "the thimble and bodkin army," and composed of shopkeepers, 'prentices, and industrious citizens, were transformed into soldiers that conquered wherever they fought, and whose deeds the legions of Cæsar never surpassed. This inspiring display of the national heartiness and military resources roused the emulative spirit of Scotland; and, as her majesty was about to pass on her way to her Highland home of Balmoral, it was resolved to inaugurate her arrival in Edinburgh with a review of the Scottish volunteers. The day appointed was the 7th of August, 1860, and the place that extensive level ground called the Queen's Park, between the palace of Holyrood and picturesque range of hills called Salisbury Craigs. Then and there such a military muster took place as Edinburgh had never witnessed since the great gathering upon the Borough Muir previous to the national calamity of Flodden; but here how different were the auspices under which the descendants of the gallant array of James IV. were assembled! It was indeed still a competition of Scotland with England, but a competition of brotherly affection, in which each nation was to vie with the other in alacrity and preparation for mutual defence against a common foe, with the queen of both lands as spectator and judge. On this occasion 21,000 volunteers from every part of Scotland were manœuvred in the park, and at least ten times that number of spectators were clustered upon the banks of the lake and the slopes which bounded the amphitheatre, looking down upon that magnificent moving pageant of war, and the sovereign who stood beneath the shade of the royal banner receiving the homage of each corps as it passed by. And who of all those spectators could still be fearful of invasion or doubtful of the issue? The confidence that enhanced the universal gladness of the spectacle was like the awakening from a troubled dream into health, security, and daylight. These reviews of London and Edinburgh were enough to restore the public tranquillity, and give assurance of the national safety. With

at least 150,000 such citizen-soldiers, which at a short notice could be doubled, and their numerous well-trained corps of artillery, composed of the scientific and educated classes, and already fit for regular service—with these, in addition to our defences on the sea and our regular army, it was thought that we had well insured our shores against the attempt of a hostile landing. And so also, apparently, think the enemies of Britain, whose loud threat has subsided into silence or an unmeaning murmur. The glory or the profit of such an attempt is completely outweighed by the chances of utter discomfiture. Nay, even the alliance between France and Britain is thereby the more confirmed, by showing the uselessness of mutual quarrel, and the influence which their combined strength may exercise upon the troubled politics of Europe, and the welfare of the world at large.

But it is not merely in general or political considerations that we are to read the advantages of this great volunteer movement. The benefits it has conferred upon society in a social and moral point of view are so important that, even had the alarm of invasion been nothing more than one of our national periodical panics—and as such it has often been ridiculed by an extreme party of politicians—the bustle of preparation, the drill, the marching and countermarching, the jostling of arms with the regular operations of industry, have been well worth the interruption, the trouble, and the sacrifice. The long cessation from war had made us the less prepared for its coming, and the study of it even as the means of self-defence was in course of general abandonment. The mercantile spirit was obtaining too exclusive possession, and the point of honour degenerating into the question of who could the most adroitly drive a bargain, and the soonest realize a fortune. The occupations of the shop, the warehouse, and the counting-house were not only absorbing the whole mental energies, but even the physical capacities of young ardent manhood; so that, while there was little opportunity for those active out-door sports which best develop the physical qualities, that chivalrous sensitiveness by which a nation is best protected, and without which it languishes and dies, was giving place to an ill-judged confidence in the power of wealth, and the sufficiency of our industrial resources. These consequences of such a long and prosperous course of traffic were heedfully noted and heavily deplored by thoughtful, patriotic philanthropists, while they were unable to discover a remedy so powerful and so universal as would suffice to arrest the evil. And then, happily for us, the remedy of remedies which they could not find was brought to us from an unexpected quarter. We

were to be invaded, and this too by France, the country with which, of all others, we had been in rivalry for ages, and whose enmity we had most to fear. It was a national alarm, but it was also more, for it was regarded as a national insult; and, stung with the thought, the whole nation started from sleep, snatched up their weapons, and rushed forth to meet the danger. Even if the cry of warning was groundless, it broke the spell, warned us of what might eventually be our fate, and roused into full activity that ancient spirit under which our land has grown so prosperous and so great. It has infused a new life into our mercantile character, the tendency of which will be to introduce a chivalrous uprightness and dignity into the transactions of the mart and the operations of the workshop. Even the step, the look, the bearing of our young men are undergoing a transformation that betokens a soldierly openness, activity, and confident self-reliance, in lieu of those slouching steps, and careworn, money-reckoning looks by which our streets and public haunts were crowded. The future merchant-princes of Britain are thus in training to occupy that proud position which should be held in princely character, and into which nothing that is mean or sordid should enter; and, while peer and peasant are serving in the same ranks, and united in one common military fellowship, the invidious separations of rank and wealth, which have so long been a social evil among our people, will be qualified and abated. This volunteer movement, instead of a temporary, promises to be a permanent institution; and, by the moral and social changes which it has already originated, it may even yet, without being needed for actual conflict, become the best safeguard of our country, by the new life it has infused, and by the fresh impress which it will stamp upon the community.

Having thus brought onward the course of our narrative to the events which are passing before our eyes, and movements which await their development, our task is ended. And yet, how pregnant is the present with matter for history which future ages will peruse with wonder! Time and space have been controlled, so that years have become sufficient for the changes of centuries; and amidst the fancied stability of to-day, we know not what to-morrow may bring forth. Europe is still heaving with stormy elements, that are full of a portentous futurity; and even before the present generation has

passed away, what thrones may be over-turned, what nations committed to a prosperous rise or mournful extinction? "This is not the world into which I was born," is emphatically the exclamation of our old men; but how much more justly it will be repeated by their successors! And what, amidst these mutations, will be the destiny of our own Britain? Has she already reached that culminating point beyond which all is a progress of decay? Or does she possess that innate vigour and vitality which will secure for her an old age extended beyond the usual term of the life of nations? These are considerations that force themselves upon us, as we close the volume, and look wistfully into the future. They are questions which all will be ready to propound—but who can answer them? Let us hope, however, as we may, we cannot expect any nation to be immortal; and that each must pass away in turn, and give place to younger communities, seems necessary for the progress of humanity at large. Even with this mournful conviction upon us, we are consoled with the thought that Britain has not lived in vain. Selected by the great Ruler of Nations to be the standard-bearer, not only of political freedom, but religious truth, she marched at the head of the world's pilgrimage onward and heavenward through the wilderness; and when darkness gathered, she turned from the erring counsels of men to the pillar of fire, the unfailing light of eternal truth, and carried onward the heaven-bestowed banner in the right path, notwithstanding the murmurings and rebellion of the multitude. And thus her sacred commission, her long career of unexampled greatness and prosperity, and the blessings it has imparted to the world at large, are the best assurances that the evil day will be late in coming; and that when come it must, her decay will be gentle, and her end amidst honour and regret, while those nations that succeed her will be enriched with her discoveries, enlightened by her wisdom, and animated by her example. Even when her cities become mouldering ruins, they will still be the honoured resting-places of the world's pilgrimage; and the events of which they are the memorials will be recorded in every language, as a glory of past ages which time can only beautify and brighten. In this hope let us find our consolation. Such a prospect, next to imperishability itself, is the highest, noblest, and most desirable of national destinies.

INDEX

TO THE

COMPREHENSIVE HISTORY OF ENGLAND.

A.

Abaris, the Hyperborean, i. 55.
 Abbeyes plundered and dismantled by Henry VIII., i. 810-12; destruction of, and monasteries in Scotland at Reformation, ii. 81, and *note*.

LONDON: 44, PATERNOSTER ROW, E.C.

Just completed, in 36 Parts, imperial 4to, 2s. 6d. each; or elegantly half-bound, morocco, gilt edges, £5, 5s.

THE IMPERIAL ATLAS

OF MODERN GEOGRAPHY;

A Series of One Hundred carefully coloured Maps, embracing the most recent Discoveries, and the latest Political Divisions of Territory in all parts of the World. Compiled from the most authentic sources, under the supervision of W. G. BLACKIE, Ph.D., F.R.G.S. With an INDEX, containing References to nearly 120,000 Places.

In fulness and accuracy of information, largeness of scale, and clearness of engraving, this Atlas will compare favourably with the most costly works of the kind extant. It is portable, and can be consulted with ease, being an imperial 4to, measuring when closed 15 inches by 11 inches. The Maps are printed on paper measuring 22 inches by 15, and carefully coloured. The Series extends to Seventy-eight such Sheets, comprising above One Hundred different Maps.

"After a careful perusal of the whole work, we can safely say that we know of no Atlas, published at the same low price, which is so copious and accurate in detail, so clearly printed, and so well engraved; that no maps have been hitherto constructed on scales so carefully adapted to the relative importance of countries, as viewed from the stand-point of English merchants and general readers."—*London Review*.

In 30 Parts, imperial 8vo, 2s. 6d. each.

THE IMPERIAL GAZETTEER:

A GENERAL DICTIONARY OF GEOGRAPHY,

PHYSICAL, POLITICAL, STATISTICAL, and DESCRIPTIVE; including comprehensive Accounts of the Countries, Cities, Principal Towns, Villages, Seas, Lakes, Rivers, Islands, Mountains, Valleys, &c., in the World. Edited by W. G. BLACKIE, Ph.D., F.R.G.S. Illustrated by nearly SEVEN HUNDRED AND FIFTY ENGRAVINGS, printed in the Text, comprising Views, Costumes, Maps, Plans, &c. Two large Volumes, 2670 pages, imperial 8vo, cloth, £4, 6s.

"This excellent book of reference. . . . All the articles we have examined, whether long or short, exhibit a greater degree of correctness in minute detail than we should

have thought practicable in so comprehensive a work."—*Athenaeum*.

"By far the best Gazetteer in our language."—*Critic*.

In 30 Parts, imperial 8vo, 2s. 6d. each. ●

THE IMPERIAL DICTIONARY,

ENGLISH, TECHNOLOGICAL, AND SCIENTIFIC;

On the Basis of Webster's English Dictionary, with the addition of many Thousand Words and Phrases, including the most generally used Technical and Scientific Terms, together with their Etymology and their Pronunciation. Also a SUPPLEMENT, containing an extensive collection of Words, Terms, and Phrases, not included in previous English Dictionaries. By J. OGILVIE, LL.D. Illustrated by above 2500 Engravings on Wood.

"Dr. Ogilvie has not only produced the best English Dictionary that exists, but, so far as the actual state of knowledge permitted, has made some approach towards perfection."—*British Quarterly Review*.

"The most comprehensive work of the kind we possess. We have examined attentively, and can report most favourably of its execution."—*Atlas*.

In 36 Parts, imperial 4to, 2s. 6d. each.

THE IMPERIAL FAMILY BIBLE,

Containing the OLD and NEW TESTAMENTS, according to the most Correct Copies of the Authorized Version. With many Thousand Critical, Explanatory, and Practical Notes; also, References, Readings, Chronological Tables, and Indexes. Illustrated by a Superb Series of Engravings.

The Engraved Illustrations, 74 in number, consist of a Series of Historical Subjects, selected with much care and research from the Works of the Old Masters, and from those of the

existing Schools of Painting on the Continent and in Britain, and a Series of Views of important Bible Localities, from authentic drawings; the whole engraved in the most finished manner.

Complete in 36 Parts, 2s. each, forming 4 handsome Volumes, super-royal 8vo.

THE COMPREHENSIVE HISTORY OF ENGLAND,

CIVIL and MILITARY, RELIGIOUS, INTELLECTUAL, and SOCIAL: from the Earliest Period to the Suppression of the Sepoy Revolt. By CHARLES MACFARLANE and the Rev. THOMAS THOMSON. Illustrated by above Eleven Hundred Engravings on Wood and Steel—Views, Costumes, Portraits, Maps, Plans, &c., &c.

"We regard this publication as by far the most beautiful, cheap, and really 'comprehensive' history of the nation which has ever yet appeared."—*John Bull*.

"An admirable record, not only of military and political

events, but of moral and intellectual progress, thus comprising, in fact, a real History of England."—*Civil Service Gazette*.

"This ought emphatically to be entitled the Family History of England."—*Morning Herald*.

Publishing in Parts, super-royal 8vo, 2s. each.

A COMPREHENSIVE HISTORY OF INDIA,

CIVIL, MILITARY, and SOCIAL, from the first landing of the English, to the suppression of the Sepoy Revolt, including an Outline of the Early History of Hindoostan. By HENRY BEVERIDGE, Esq., Advocate. Illustrated by above Five Hundred Engravings on Wood and Steel. It will extend to 25 Parts.

"This elaborate and able work is indeed more comprehensive than its title would imply, for it gives us with philosophical discrimination the ancient, mediæval, and modern history of a most singular people, who were well fed and well clad, who had a written language, and composed metaphysical treatises, when the forefathers of the race that now bears away over two

hundred millions of them were still wandering in the woods of Britain and Germany, all of them savages, and some perhaps cannibals.

The numerous engravings on wood and steel, remarkable for their beauty and fidelity, contribute greatly to the interest and even to the instructive power of the work."—*Examiner*.

New and revised edition, in Parts, 2s., and Divisions, 10s. each.

THE POPULAR ENCYCLOPEDIA; OR, CONVERSATIONS LEXICON.

Being a General Dictionary of Arts, Sciences, Literature, Biography, History, and Politics; with Preliminary Dissertations by distinguished Writers.

The POPULAR ENCYCLOPEDIA has been before the public for many years past, and has met with a large measure of acceptance. The alterations and corrections made for the present edition render the Work a satisfactory exponent of the state of knowledge in the present day. The articles on Botany, Chemistry, and Geology have been wholly re-written, and the scientific articles generally have been carefully revised; and those on Geography, Topography, History, Theology, and Biography have been subjected to a rigid examination.

An entirely new SUPPLEMENT has been written, containing additional biographies, notices of localities newly discovered, or that have risen recently into importance—of substances and processes new in science and the arts—of the great events of the world during the last twenty years—and other subjects of general interest.

The illustrations of the POPULAR ENCYCLOPEDIA have been augmented fully a half, and extend to One Hundred and Fifty-four Pages of Steel Engravings, and Fourteen Coloured Maps, besides many Engravings on Wood. The whole Work, including Supplement, will be completed in 63 Parts, price 2s. each; or in 14 Divisions, 10s. each.

In 23 Parts, 2s. 6d. each; or 2 large Vols., 2250 pages, super-royal 8vo, cloth, £3, 15s.

MORTON'S CYCLOPEDIA OF AGRICULTURE, PRACTICAL AND SCIENTIFIC:

In which the Theory, the Art, and the Business of Farming, in all their departments, are thoroughly and practically treated. By upwards of Fifty of the most Eminent Farmers, Land-Agents, and Scientific Men of the Day. Edited by JOHN C. MORTON. With above 1800 Illustrative Figures on Wood and Steel.

The object of this Work is to present to the Agricultural reader the whole of the truth immediately connected with his profession, so far as it is known to the men most familiar with the sciences it involves, the methods it employs, and the risks it incurs. Illustrations on Wood and Steel, of Farm Buildings, Insects, Plants (cultivated and uncultivated), Agricultural Machines, Implements, and Operations, &c., are given wherever they can be useful.

In 35 Parts, imperial 8vo, 1s. each; or 2 Vols., cloth extra, 38s.

THE HISTORY OF THE BIBLE,

From the Beginning of the World to the Establishment of Christianity; and a connection of Profane with Sacred History. By the Rev. THOMAS STACKHOUSE, M.A. With copious additions from recent Commentators, Critics, and Eastern Travellers; and Complete Indexes. Also, an Appendix on the Illustrations of Scripture derived from the Egyptian and Assyrian Monuments, &c. Illustrated by Fifty highly-finished Engravings.

GLASGOW, EDINBURGH, AND LONDON.

In 46 Parts, medium 8vo, 1s. each; or in Divisions, cloth gilt, 6s. 6d. each.

BIOGRAPHICAL DICTIONARY OF EMINENT SCOTSMEN.

Originally Edited by ROBERT CHAMBERS. In Four Volumes. New and revised Edition. With a Supplemental Volume, continuing the Biographies to the Present Time. By the Rev. THOMAS THOMSON. Illustrated by Eighty-five highly-finished Portraits, and Five Engraved Titles.

In 21 Parts, super-royal 4to, 2s. each.

ITALY:

CLASSICAL, HISTORICAL, AND PICTURESQUE.

Illustrated in a Series of Views, engraved in the most finished manner, from Drawings by Stanfield, R.A.; Roberts, R.A.; Harding, Prout, Leitch, Brookedon, Barnard, &c., &c. With Descriptions of the Scenes, and an Essay on Italy and the Italians, by CAMILLO MAPPI, D.D.

"We do not know a more delightful drawing-room book than this work on Italy, which comprises upwards of sixty exquisite illustrations of the noblest and most interesting scenery in the

world, with corresponding descriptions to record the natural features, and the poetical and historical associations of each spot."—*Inverness Courier*.

Re-issue, with Coloured Plates. In 30 Parts, royal 8vo, 1s. each.

A HISTORY OF THE EARTH AND ANIMATED NATURE.

By OLIVER GOLDSMITH. With numerous Notes from the Works of the most distinguished British and Foreign Naturalists. The Plates contain 2400 Illustrative Figures, of which 230 are carefully coloured.

In 22 Parts, royal 8vo, 1s. each.

A HISTORY OF THE VEGETABLE KINGDOM;

Embracing the Physiology, Classification, and the Culture of Plants; with their various uses to Man and the Lower Animals, and their application in the Arts, Manufactures, and Domestic Economy. Illustrated by Seven Hundred Figures on Wood and Steel, of which One Hundred are beautifully coloured.

In 39 Parts, 1s. each; Divisions, cloth elegant, 6s. each; or 4 Vols., cloth, £2, 4s.

D'AUBIGNE'S HISTORY OF THE REFORMATION.

Translated by D. D. SCOTT, and H. WHITE, B.A. The Translation carefully revised by Dr. MERLE D'AUBIGNE. Large type, numerous Notes, not in any other Edition, and Forty Illustrations, beautifully Engraved on Steel.

The Emerald Edition, small 8vo, in 17 Nos., Price 6d. each.

In 20 Parts, 1s. each; or 2 Vols., cloth, £1, 1s.

A HISTORY OF THE PAPACY,

POLITICAL and ECCLESIASTICAL, in the Sixteenth and Seventeenth Centuries. By LEOPOLD RANKE. With Notes by the Translator, and an Introductory Essay by J. H. MERLE D'AUBIGNE, D.D. Illustrated by Twenty highly-finished Portraits.

In 12 Parts, super-royal 8vo, 2s. 6d. each; or 1 Vol., cloth extra, £1, 11s. 6d.

THE GARDENER'S ASSISTANT.

PRACTICAL and SCIENTIFIC. A Guide to the Formation and Management of the Kitchen, Fruit, and Flower Garden, and the Cultivation of Conservatory, Green-house, and Hot-house Plants. By ROBERT THOMPSON, Superintendent of the Horticultural Society's Garden, Chiswick. Illustrated by Twelve beautifully-coloured Engravings, each representing two or more choice Flowers or Fruits, and nearly Three Hundred Engravings on Wood.

GLASGOW, EDINBURGH, AND LONDON.

In 26 Parts, 2s. each; or 8 Vols. super-royal 8vo, cloth, £2, 14s.

THE WORKS OF JOHN BUNYAN, PRACTICAL, ALLEGORICAL, AND MISCELLANEOUS;

First Complete Edition. Carefully collated and printed from the Author's own Editions. With EDITORIAL PREFACES, NOTES, and a MEMOIR OF BUNYAN AND HIS TIMES. By GEORGE OFFOR. Numerous Illustrative Engravings.

- I. THE EXPERIMENTAL, DOCTRINAL, AND PRACTICAL WORKS. Illustrations. In 32 Parts, 1s. each.
II. THE ALLEGORICAL, FIGURATIVE, AND SYMBOLICAL WORKS. Numerous Illustrations. In 18 Parts, 1s. each.

LADIES OF THE REFORMATION.

MEMOIRS OF DISTINGUISHED FEMALE CHARACTERS,

Belonging to the Period of the Reformation in the Sixteenth Century. By the Rev. JAMES ANDERSON, Author of *Ladies of the Covenant*, &c. Nearly Two Hundred Illustrations, from Drawings by J. Godwin, G. Thomas, J. W. Archer, E. K. Johnson, &c.

FIRST SERIES.—ENGLAND, SCOTLAND, and the NETHERLANDS. Small 4to, cloth, antique, 10s. 6d.

SECOND SERIES.—GERMANY, FRANCE, SWITZERLAND, ITALY, and SPAIN. Small 4to, cloth, antique, 10s. 6d.

Cloth, antique, 7s. 6d.; or 14 Nos., 6d. each.

LADIES OF THE COVENANT;

Being Memoirs of Distinguished Scottish Female Characters, embracing the period of the Covenant and Persecution. By the Rev. JAMES ANDERSON, Author of the *Martyrs of the Bass*, &c. Numerous Engravings.

Complete in 28 Nos., 6d. each; or 2 Vols., cloth, gilt, 15s.

THE SHEEPFOLD AND THE COMMON;

OR, WITHIN AND WITHOUT.

Being Tales and Sketches illustrating the Power of Evangelical Religion, and the Pernicious Tendency of the Heresies and Errors of the Day. Illustrated by a Series of Thirty-two Page Engravings.

This Work is a new and much-improved Edition of the *Evangelical Rambler*, a title under which above One Hundred Thousand copies of it were sold. The highest testimony was

borne to its excellency when first put forth, and its re-appearance, in a revised and amended form, has met with great approval.

Complete in 20 Parts, imperial 8vo, 1s. each.

THE LIFE OF JESUS CHRIST,

With the Lives of the Apostles and Evangelists. By the Rev. JOHN FLEETWOOD, D.D. Also, the *Lives of the most Eminent Fathers and Martyrs*, and the *History of Primitive Christianity*, by WILLIAM CAVE, D.D. With an Essay on the Evidences of Christianity, and numerous Notes not to be found in any other Edition. To which is subjoined, A Concise History of the Christian Church, by the Rev. THOMAS SIMS, M.A. Illustrated by Forty beautiful Engravings.

Complete in 20 Parts, super-royal 8vo, 1s. each; or 1 Vol., cloth, 21s.

THE CHRISTIAN CYCLOPEDIA;

OR, REPERTORY OF BIBLICAL AND THEOLOGICAL LITERATURE.

By the Rev. JAMES GARDNER, M.D., A.M. With numerous Illustrations.

This Work is designed to be a popular compendium of what has hitherto been written on all those subjects which are either involved in, or allied to Christianity. It embraces in its plan the general features both of a Biblical and Theological Dic-

tionary, and a comprehensive digest of the Literature and Biography connected with Christianity. It must be regarded as a Work of high value to the readers and students of the Scriptures.

GLASGOW, EDINBURGH, AND LONDON.

BIBLES AND COMMENTARIES.

THE IMPERIAL FAMILY BIBLE,

See page 1.

THE COMPREHENSIVE FAMILY

BIBLE; with Notes and Practical Reflections; also, References, Readings, Chronological and other Tables. By DAVID DAVIDSON, LL.D. With numerous Historical and Landscape Illustrations and Maps. In 36 Parts, super-royal 4to, 2s. each.
